Foreword

The aim of the Australian Infrastructure Statistics Yearbook is to provide a single, comprehensive annual source of infrastructure statistics for use by policymakers, industry leaders, transport analysts and the wider Australian community.

The publication is primarily a source of long-term, aggregate time series infrastructure statistics. In most cases the time series extend to 2012–13. A brief introduction is provided to explain the structure of the publication and areas identified for further development. Most statistics included in the publication are currently collected by BITRE or other Australian, state or territory government agencies.

The tables are presented within a logical framework to assist the comparison and analysis of statistics across the various forms of infrastructure. This framework also identifies areas where further statistics may provide a more complete statistical picture of Australian infrastructure.

The Yearbook is presented in five Parts:

- Part I: Infrastructure and the Economy,
- Part T: Transport,
- Part E: Energy,
- Part C: Communications, and
- Part W: Water.

BITRE would like to acknowledge input from the Australian Bureau of Statistics, the Australian Communications and Media Authority, the Australian Energy Regulator, the Australian Institute of Health and Welfare, the Australian Transport Safety Bureau, the Bureau of Meteorology, the Bureau of Resources and Energy Economics, the Civil Aviation Safety Authority, the Department of Communications, the Department of the Environment, the Energy Supply Association of Australia, Geoscience Australia, the National Water Commission, the Office of the National Rail Safety Regulator and Tourism Research Australia.

Bryan Lee at the Bureau of Infrastructure, Transport and Regional Economics managed and coordinated the project. Simon O'Mahony undertook the update of the water chapter.

Gary Dolman

Contents

Foreword.....	iii
Introduction	I
PART I: INFRASTRUCTURE AND THE ECONOMY	9
Chapter 1 The economy.....	13
Chapter 2 Infrastructure construction.....	27
PART T: TRANSPORT	31
Chapter 1 Transport infrastructure.....	35
Chapter 2 Freight.....	47
Chapter 3 Passengers.....	59
Chapter 4 Road.....	75
Chapter 5 Rail.....	93
Chapter 6 Aviation.....	99
Chapter 7 Shipping	107
Chapter 8 Safety.....	121
Chapter 9 Energy and the environment.....	145
PART E: ENERGY	159
Chapter 1 Energy infrastructure.....	163
Chapter 2 Inputs to energy supply	179
Chapter 3 Energy production and usage	185
Chapter 4 Energy safety and emissions.....	241
PART C: COMMUNICATION.....	253
Chapter 1 Communication infrastructure	257
Chapter 2 Investment in information technology	259
Chapter 3 Subscribers and providers	263
Chapter 4 Price and activity	267
Chapter 5 Communications security.....	271

PART W:	WATER.....	273
Chapter 1	Water infrastructure	277
Chapter 2	Water inputs.....	291
Chapter 3	Supply and use.....	297
Chapter 4	Health and emissions.....	325
	End notes and definitions.....	331
	References.....	361

List of tables

Table I 1.1a	Australian gross domestic product, major infrastructure industries.....	13
Table I 1.1b	Australian gross domestic product, transport industry.....	14
Table I 1.2a	Australian employment, major infrastructure industries— transport and storage	15
Table I 1.2b	Australian employment, major infrastructure industries—energy	16
Table I 1.2c	Australian employment, major infrastructure industries—communication ...	17
Table I 1.2d	Australian employment, major infrastructure industries—water.....	18

Introduction

Introduction

The goal of the Australian Infrastructure Statistics Yearbook is to provide a comprehensive, coherent summary of major economic infrastructure in Australia and its use. A framework of time series statistics was developed with this end in mind. A range of datasets of varying quality are available. Datasets that meet BITRE requirements for accuracy and reliability are included; however, there are a number of areas of the framework where suitable datasets are not currently compiled. These areas of unmet statistical demand are highlighted in the section headed For Further Development, at the end of this introductory chapter.

The framework

Part I of the Yearbook provides a summary of major economic infrastructure and several statistical measures likely to influence investment in, and use of, major economic infrastructure. The rest of the Yearbook is divided into four sections, focussing on each of the four themes of major economic infrastructure:

- Part T, for transport infrastructure;
- Part E, for energy infrastructure;
- Part C, for communications infrastructure; and
- Part W, for water infrastructure.

To enable comparison and aggregation across infrastructure types, the Yearbook uses a common statistical framework across each of the main infrastructure parts. Where data are available, statistics are provided using common measures.

The statistical framework covers several key areas:

- Physical infrastructure. Measures include the value and capacity of infrastructure at a given time ('stock' measures); additions to the amount of infrastructure (construction) and reductions (depreciation) that take place during the year ('flow' measures); and measures of the quality of the infrastructure.
- Inputs. Measures of non-capital inputs to activities that rely on infrastructure.
- Activity. Measures of activities associated with infrastructure. These activities may be grouped into themes. For example, for Part T (transport), these themes include freight, passengers, road, rail, aviation and maritime.
- Impacts. Measures of the external impact of activities. These impacts include safety and security issues as well as greenhouse gas emissions and other pollution.

Part I Infrastructure and the economy

Appropriately prioritised infrastructure projects should enhance economic efficiency and improve productivity.

Chapter 1 of Part I provides several key macroeconomic indicators that are likely to influence, or be influenced by, activity associated with infrastructure. Where available, the contribution of detailed infrastructure industries to the key macroeconomic indicator is provided. This chapter provides estimates of production, employment, wages and salaries, prices, international trade, interest rates, the Australian currency exchange rate and the Australian resident population.

Chapter 2 of Part I summarises infrastructure construction activity across the four forms of major economic infrastructure covered in the Yearbook.

Part T Transport

Chapter 1: Transport infrastructure. This chapter provides a number of measures of the construction of transport infrastructure as well as measures of the length of roads available for public use and road construction price indexes.

Chapter 2: Freight. In its broadest sense, freight transport describes the movement of physical items between locations. A summary of freight statistics is provided, classified by mode of transport. Freight is further classified into bulk and non-bulk segments. Two measures of freight transport are currently provided in the framework: the weight of freight moved in Australia (measured in millions of tonnes) and freight by weight and distance moved (measured in tonne kilometres—the transport task performed in moving one tonne of freight one kilometre).

Chapter 3: Passengers. In a similar fashion, passenger transport describes the movement of people between locations. This definition of passengers does not include drivers of freight vehicles when they are employed for freight purposes but does include drivers of freight vehicles when they are being used to transport passengers (e.g. private use of light commercial vehicles). The framework provides a summary of passenger statistics, classified by mode of transport (some measures of walking and cycling to work are available in Table T 3.4, but estimates for recreational boating are not currently provided in this publication). Two measures of passenger transport are currently provided in the framework: the number of people transported and the number of passenger kilometres travelled (a measure of the transport task performed in moving one passenger one kilometre).

Chapters 4–7: Road, Rail, Aviation, Shipping. These chapters focus on the four main motorised modes of transport: road, rail, aviation and shipping. Where possible, data are classified by location in terms of state or territory (interstate, intrastate, intercapital) or level of urbanisation.

Price data are included in the framework to provide an indication of the costs of each mode of transport. Price estimates for shipping and rail are not readily available.

The framework also includes estimates for the size and characteristics of the various modal vehicle fleets.

Chapters 8 (Safety) and Chapter 9 (Energy and the Environment) complete the statistical framework for transport infrastructure with a summary of some key impacts of transport activity.

Chapter 8 presents statistics for transport accidents and casualties with comparisons by mode of transport; state or territory of accident; and severity of injuries.

Chapter 9 provides direct energy consumption and emissions data by transport activity. This includes estimates for fuel sales, fuel prices and the production and international trade of transport fuels, classified by petroleum fuel type, as well as estimates of transport emissions, classified by transport mode and emission type.

Part E Energy

Chapter 1: Energy infrastructure. This chapter provides a number of measures of energy infrastructure construction as well as measures of the length of electricity networks, capacity of electricity generation plants and reliability of electricity supply.

Chapter 2: Inputs to energy supply. Chapter 2 provides a summary of inputs to energy infrastructure; including measures of mineral energy reserves, and energy used in the generation of electricity and natural gas distribution.

Chapter 3: Energy production and usage. The first few tables in Chapter 3 provide a summary of energy production in Australia of all main primary fuels and energy imports and exports. The remaining tables provide energy usage details for key specific energy types:

- For electricity, detailed usage statistics are provided by state/territory and industry, with further detail provided for the number of customers and electricity prices facing residential consumers in each capital city.
- For gas, detailed usage statistics are provided by state/territory and industry, as well as gas prices facing residential consumers in each capital city.
- For black coal, detailed usage statistics are provided by state/territory and industry, as well as time series statistics for export prices for black coal.
- For brown coal, detailed usage statistics are provided, classified by industry for New South Wales and Victoria.
- For petroleum fuels, detailed usage statistics are provided by state/territory and industry, as well as time series statistics for a range of international measures of crude oil prices.

Chapter 4: Energy safety and emissions. Measures of the external impacts of energy usage are provided for serious injuries and greenhouse gas emissions. The electricity generation industry plays a unique role in greenhouse gas statistics within the Kyoto framework: Greenhouse gas emissions from the electricity generation industry represent all 'scope 2' ('upstream' or indirect) emissions for other industries (see Table E 4.2).

Part C Communication

The Yearbook focuses on key networks that enable economic activity. Telecommunications networks are a vital part of Australian infrastructure; however, the telecommunications industry is becoming increasingly integrated with the radiocommunications and broadcasting industries. At the same time, rapid advances in technology have enabled a dramatic expansion in the capacity of existing physical infrastructure in the communications industry.

To provide a meaningful summary of Australian communications infrastructure, Part C includes measures of both physical infrastructure (see Chapter 1) and technology investments that enhance infrastructure capacity (see Chapter 2). Chapter 3 provides estimates for fixed and mobile telephone and internet subscribers and internet service providers.

Chapter 4: Price and activity. This chapter provides estimates of internet usage and internet commerce, as well as telecommunication prices facing residential customers in each capital city, indicative broadband subscription prices and domain name registration statistics.

Chapter 5: Communication security provides statistics for the number of telephone numbers registered on the do not call register and the number of emergency calls to 000 and 112.

Part W Water

A significant number of tables presented in Part W:Water were compiled by BITRE using data published by the National Water Commission (NWC) and their state and territory partners in two annual National Performance Reports (NPR); one for urban utilities and the other for rural water service providers.

The urban and rural NPRs provide comprehensive data on water supply and wastewater treatment activity for major water utilities (above 10,000 properties) in Australia using a common set of measures. While the data provided in the NPRs are comprehensive, records for a number of utilities are incomplete, so simply aggregating the published data to create Yearbook tables would underestimate state and national totals. To address this issue, prior to aggregating NPR data and where possible, BITRE filled in missing records by researching utilities' annual reports, council reports, state health authorities' water records or used statistical imputation techniques. For 2012–13, the urban NWC based sections of the yearbook include data from 82 urban major water utilities and the rural NWC based sections include data from 14 rural water service providers.

Chapter 1: Water infrastructure. This chapter provides measures of the construction of water infrastructure that are consistent with construction measures used in earlier parts of the Yearbook. In addition, there are several stock measures (including the current value of water infrastructure assets, the capacity of major water storage dams, the current holdings of major water storage dams, and the length of water distribution networks) and infrastructure quality measures for water supply, wastewater treatment and rural water supply networks.

Chapter 2: Water inputs. Table 2.1 provides volume estimates for total Australian rainfall each calendar year. The remaining tables in Chapter 2 provide measures of:

- sources of water used in urban and rural water distribution networks and sources of wastewater for wastewater treatment networks
- water supply prices facing residential customers in each capital city
- power consumed to provide rural water distribution
- trading activity in rural water markets.

Chapter 3: Supply and use. Chapter 3 provides a summary of annual water usage in Australia. Statistics are provided for the services provided by major water utilities (urban water; urban wastewater and rural water) in terms of the population that their networks serve, the number of customer connections to the network and the volume and nature of water supplied. In addition, Chapter 3 provides a summary of water consumed by agriculture, including water sourced from rural water supply networks as well as other sources.

Chapter 4: Health and emissions. Chapter 4 provides measures of water quality for urban water supply, sewer overflows to the environment and greenhouse gas emissions from urban and rural water supply and wastewater treatment.

For further development

The preparation of a publication such as this highlights the differences between the conceptual framework and the reality of the infrastructure statistics that are currently available. There are several areas of the framework where current statistical coverage is sparse and further compilation work is required to present a complete statistical picture of Australian infrastructure activity.

Publication layout

Diagrams are provided at the commencement of each Part which summarise statistics presented in the tables that follow. These diagrams highlight the areas of the conceptual framework where statistics are unknown or not available.

Throughout this publication, End Notes are numbered consecutively within each Part. References provided at the bottom of tables relate to the most recent issue of the statistical publication. Where a complete time series is not available from the most recent issue, earlier issues were used.

PART I: Infrastructure and the economy

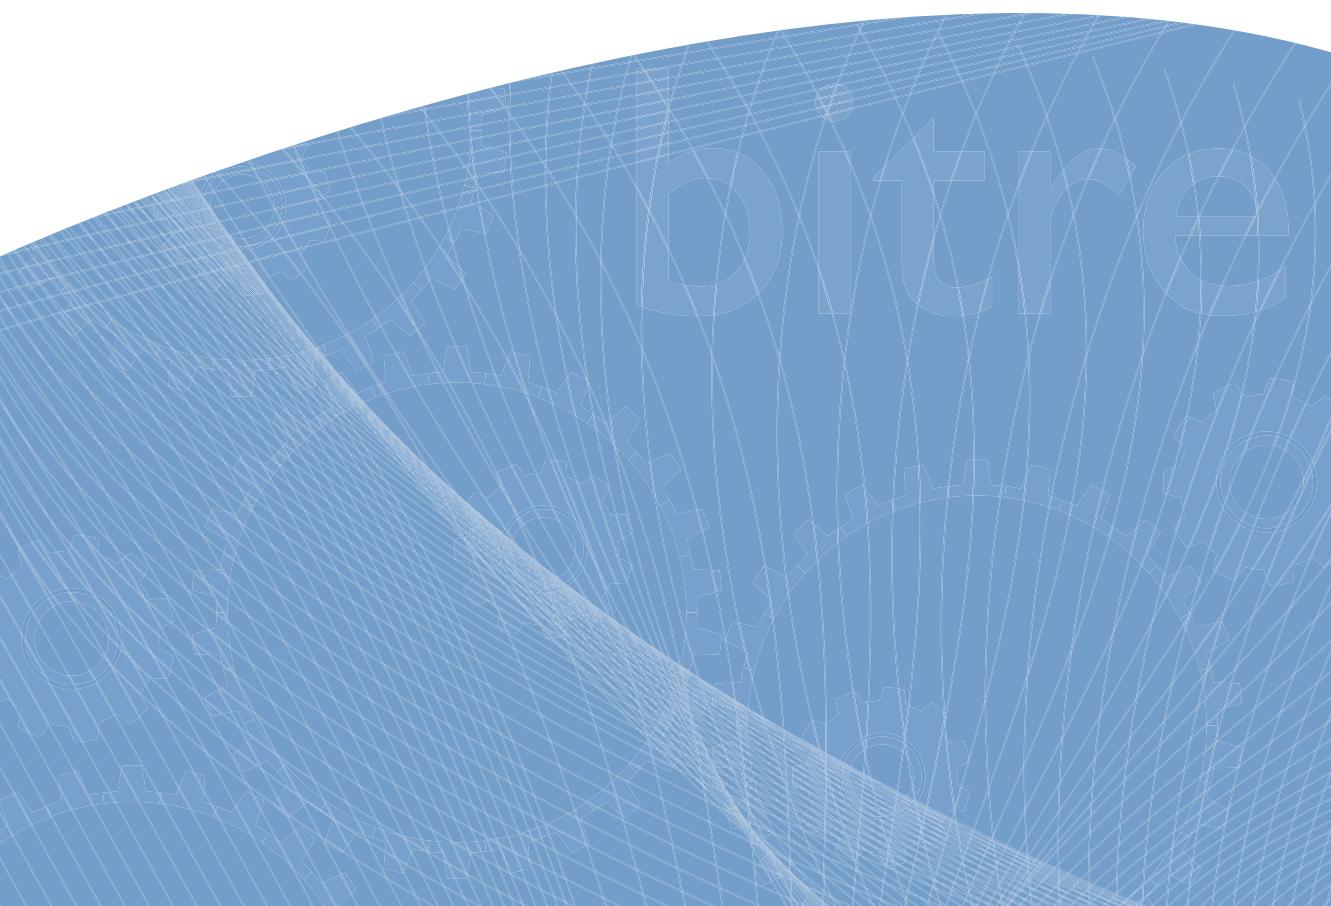

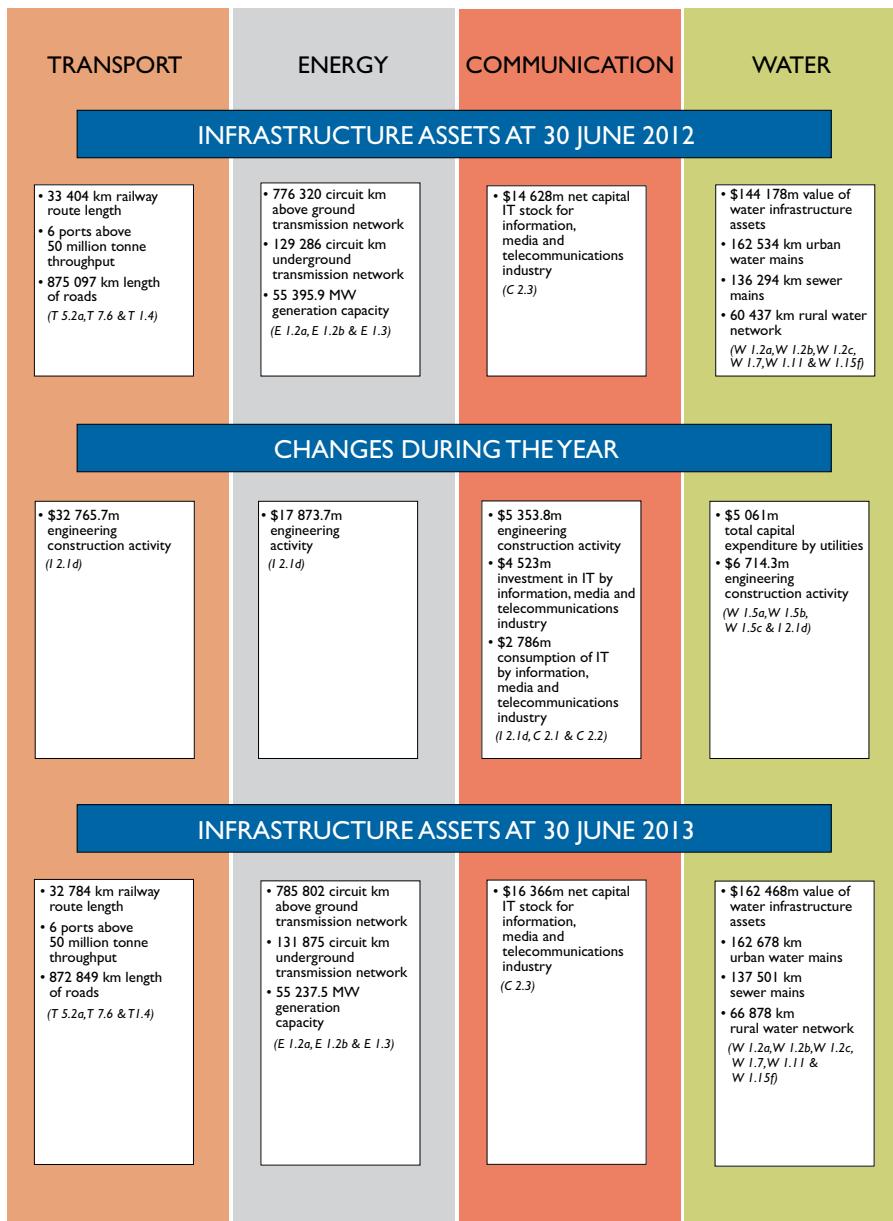

Figure 11 Australia's key economic infrastructure at 30 June 2012 and 30 June 2013

Notes:

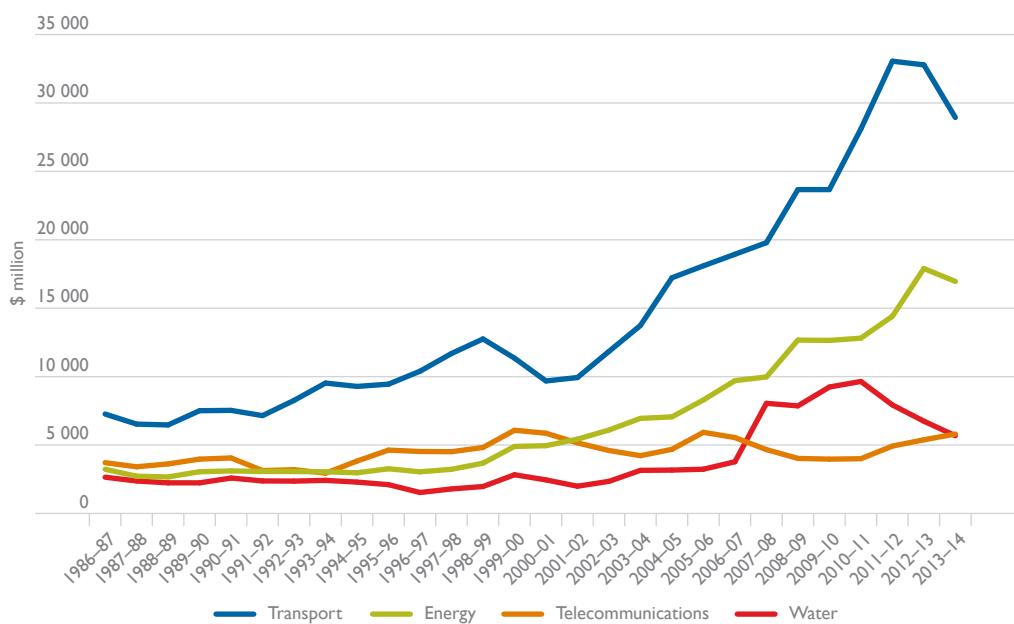

1. Railway route length refers to lines that are operational. The reduction in route length is primarily due to the closure of some grain lines in Western Australia. Small changes also occurred in other states, primarily due to the mothballing of some regional lines. There are ongoing discussions among interested parties to re-open a number of grain lines in Western Australia as well as the Demondrille—Greenthorpe/Blayney lines in NSW.
2. The decline in total road length in 2012 and 2013 is driven by a reclassification of several Queensland local roads as 'Undetermined', excluding them from the count. This effect reduced Queensland's non-urban local road total by an estimated 1,100 kilometres in 2011, a further 1,900 kilometres in 2012, and another 3,500 kilometres in 2013. (A cumulative effect of approximately 6,500 kilometres in the period 2010–2013).
3. The value of water infrastructure assets for 2012–13 does not equal the 2011–12 value plus capital expenditure during 2012–13 financial year. This is due to several factors including the likely revaluing of water and sewerage infrastructure assets.

PART I:

Infrastructure and the economy

The main source of infrastructure statistics used by BITRE is the ABS publication, Engineering Construction Activity, Australia (ABS cat. no. 8762.0). This publication provides measures of non-building construction, classified by major form of infrastructure: transport (roads, rail, ports, etc), energy (electricity and gas transmission networks, etc), telecommunications networks, and water supply and distribution networks.

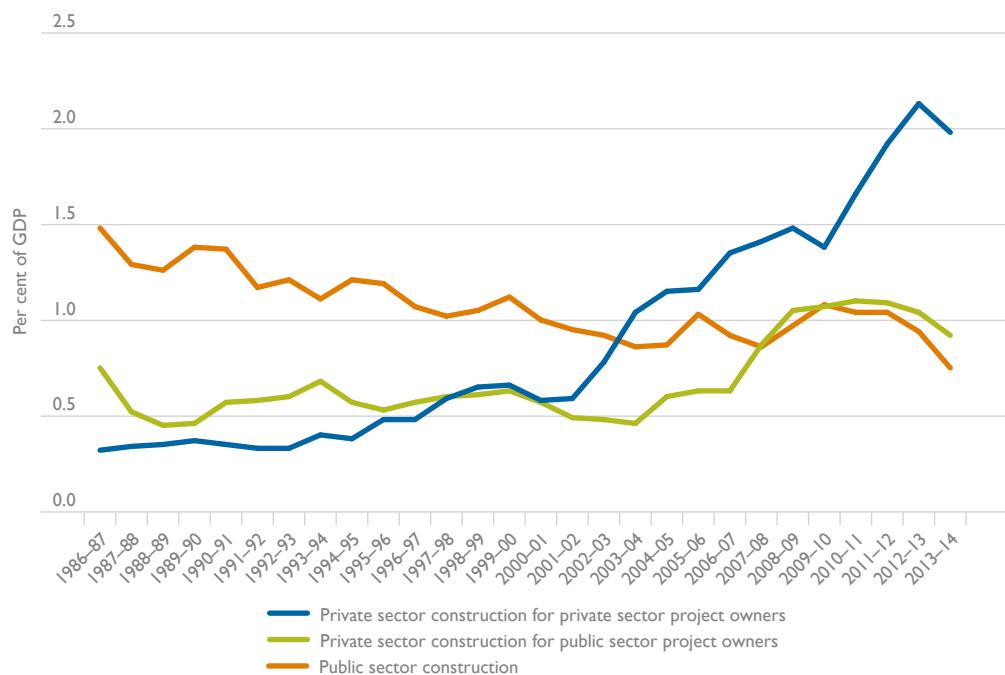

Figure I 2 Infrastructure construction activity, adjusted by chain volume index

Since 2001, Australian real infrastructure construction activity has increased strongly, mainly due to sharp increases in the construction of transport, water and energy infrastructure. Growth in transport infrastructure construction increased in 2009–10 to 2011–2012. However, the value of construction activity stabilised in 2012–13 and decreased in 2013–14.

Water infrastructure construction expenditure increased sharply in 2007–08 and again in 2009–10, reflecting work conducted on the South East Queensland Water Grid and the Victorian desalination plant. With the completion of these projects, expenditure on water infrastructure is decreasing.

Figure I 3 Infrastructure construction activity, by sector, adjusted by chain volume index

Since 2000, private sector involvement in the construction of infrastructure has increased sharply: initially in the form of private sector-owned projects, then from 2005 in the form of private sector construction of public sector projects. Public sector construction activity gradually decreased between 1987 and 2007, stabilising at approximately 1 per cent of GDP before decreasing to 0.75 per cent in 2013–14.

CHAPTER I

The economy

PART T: Transport

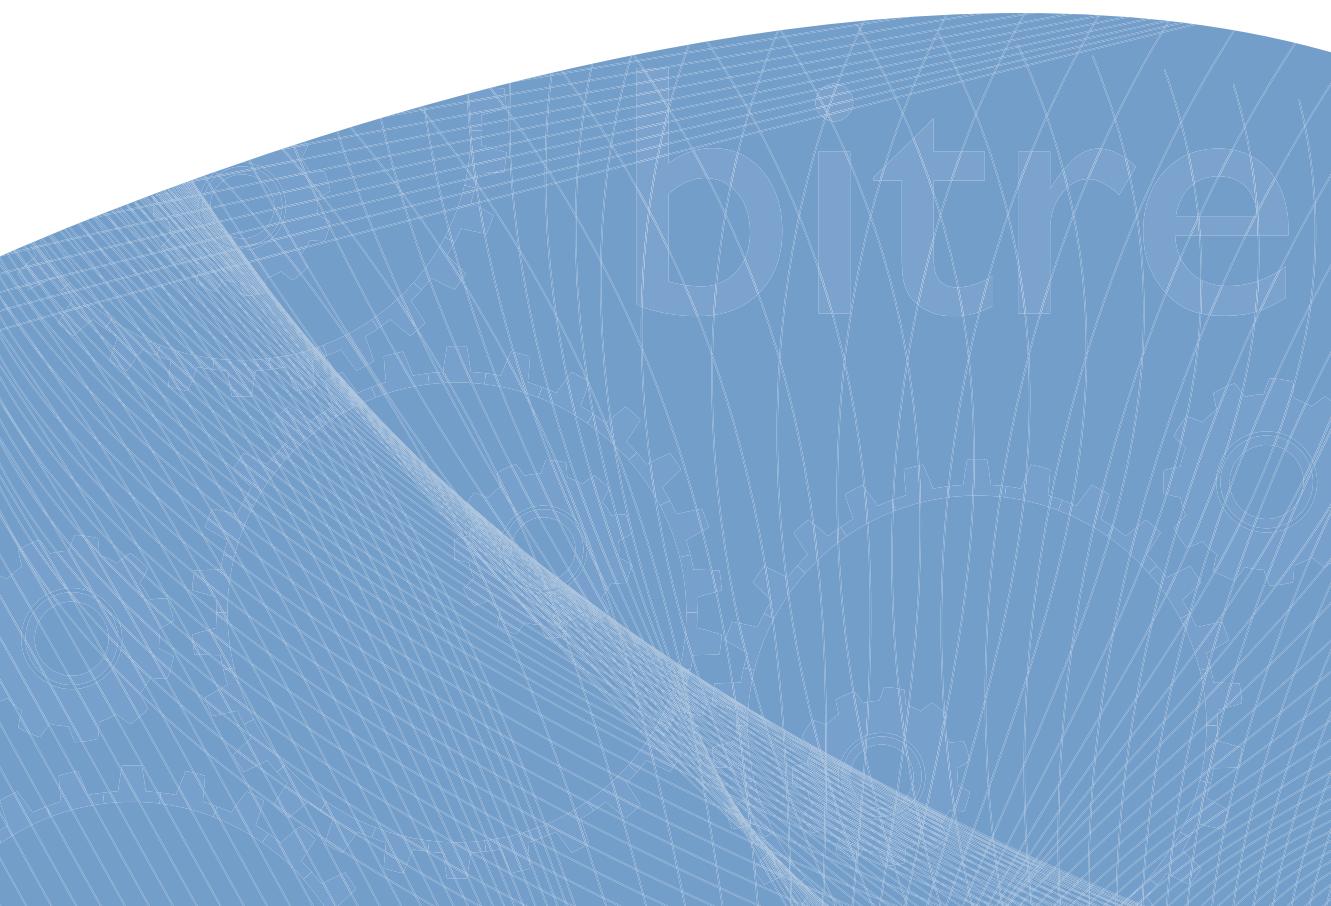

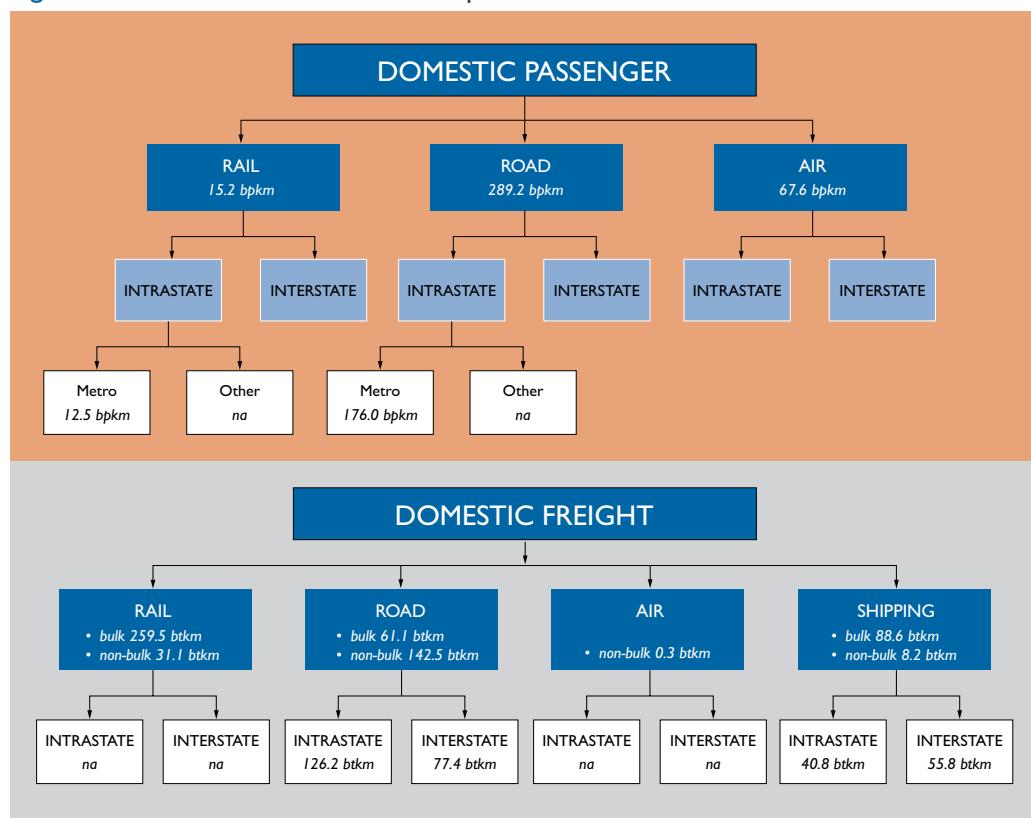

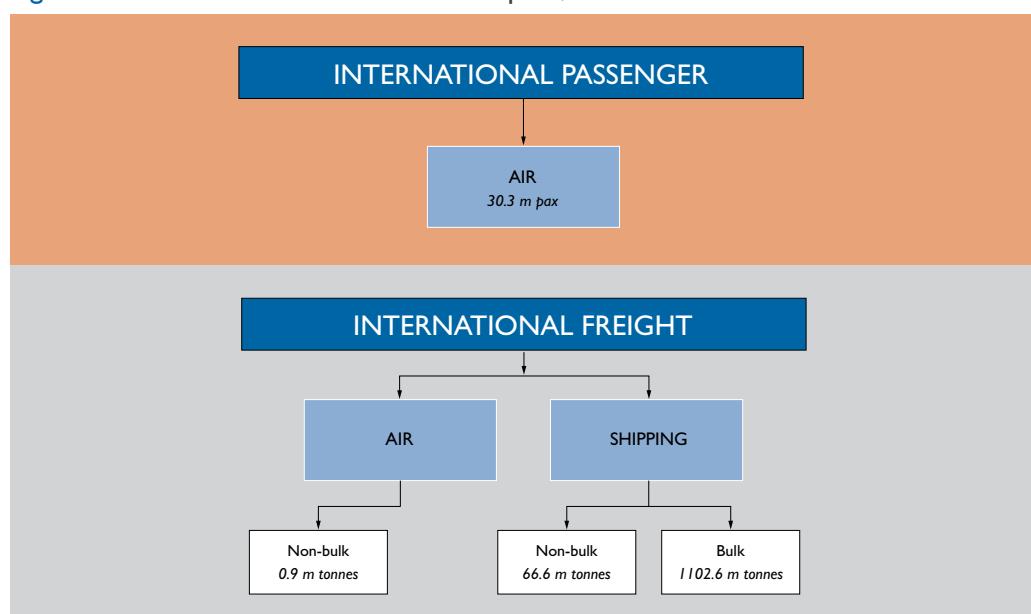

Figure T 1a Australia's domestic transport, 2012–13

Note: Metropolitan refers to the eight capital cities: Sydney, Melbourne, Brisbane, Adelaide, Perth, Hobart, Darwin and Canberra.

Note: Numbers are for 2012–13 except rail freight (2011–12).

Figure T 1b Australia's international transport, 2012–13

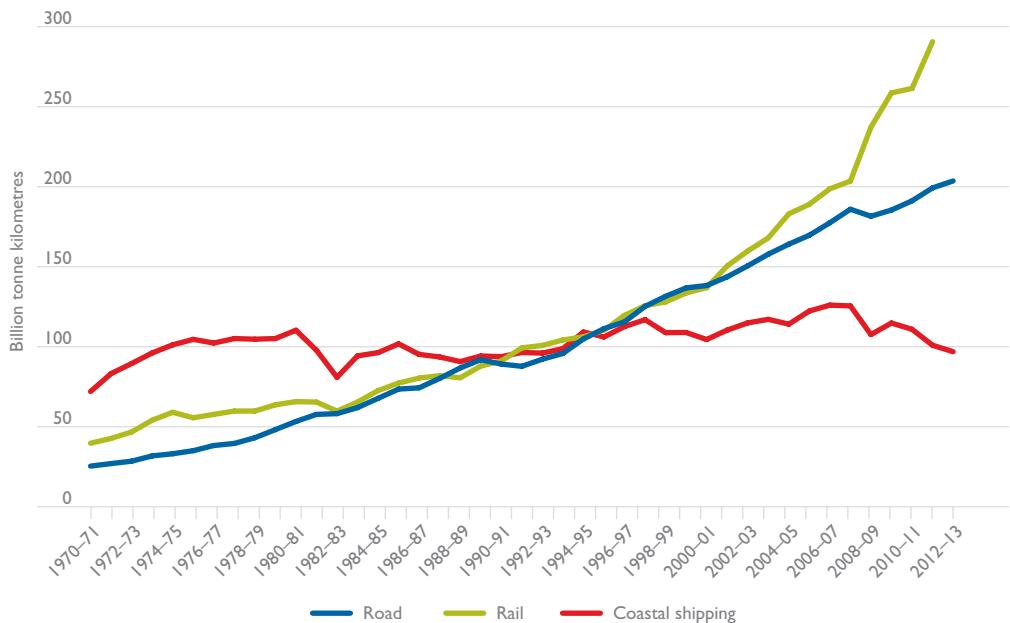

PART T

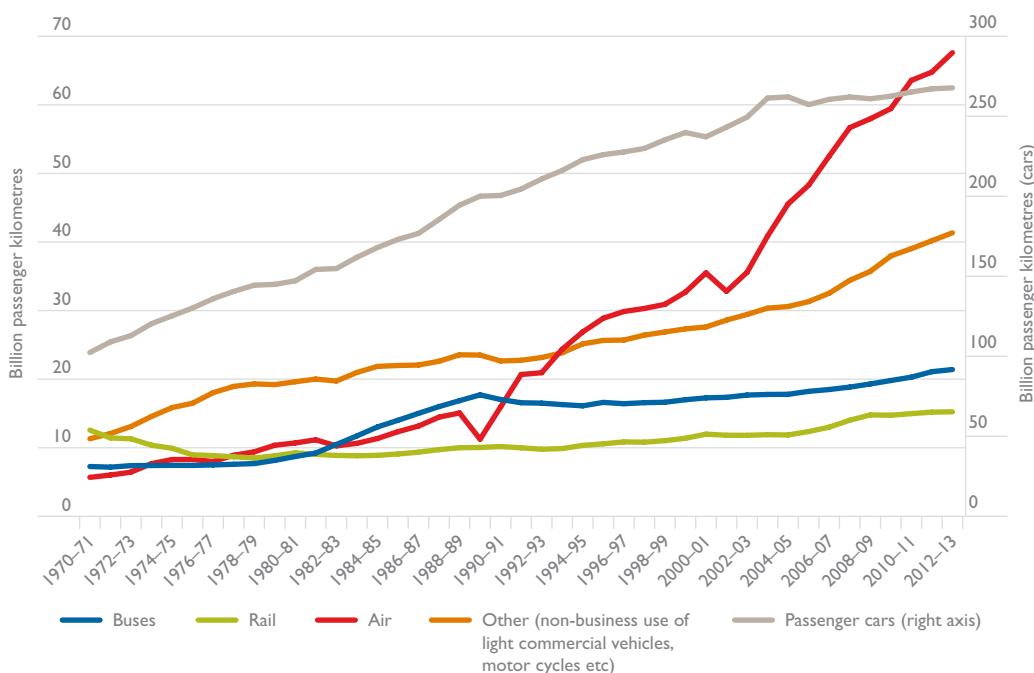

Transport

Statistics for Australian transport activity are provided from two perspectives: transportation activity measured in terms of what is being transported (freight or passengers), or transportation activity by mode (road, rail, aviation or shipping).

Figure T 2 Australian domestic freight task, by mode of transport

Freight transport activity is measured in terms of tonne kilometres (the movement of one tonne of freight, one kilometre). The Australian domestic freight task has been increasing strongly for the last 40 years, with road and rail freight now dominating domestic freight activity. Coastal freight has decreased from its peak in 2006–07.

Figure T 3 Australian domestic passenger task, by mode of transport

Passenger transport activity is measured in terms of passenger kilometres (the movement of one passenger; one kilometre). The Australian domestic passenger task is dominated by road transport, mainly passenger cars (right axis), which remained relatively constant in the six years to 2009–10 but grew steadily since 2010. Passenger travel on other modes increased in recent years, with travel by air increasing rapidly since 2001.

CHAPTER I

Transport infrastructure

Table T 1.1a Value of transport infrastructure engineering construction work done by the private sector for the private sector, adjusted by chain volume index

CHAPTER 5

Rail

Figure T 5 Australia's railways, by network manager

Note: *The lines shown here are the railways that are open for traffic at July 2014. There is discussion amongst interested parties to re-open a number of grain lines in WA as well as the Demondrille–Greenthorpe/Blayney lines in NSW.

Table T 5.1a Intercapital rail distances—freight terminals

PART E: Energy

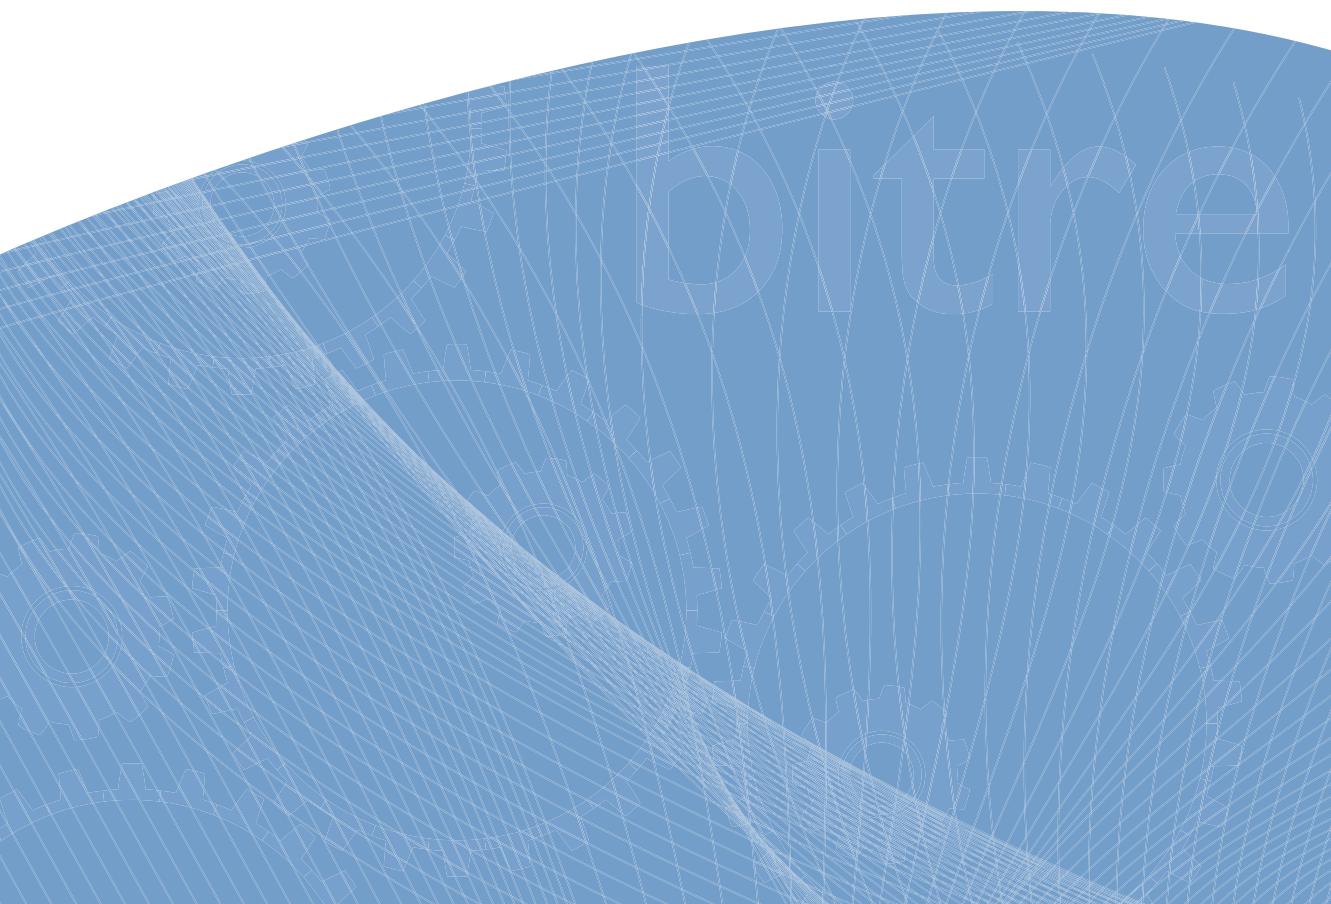

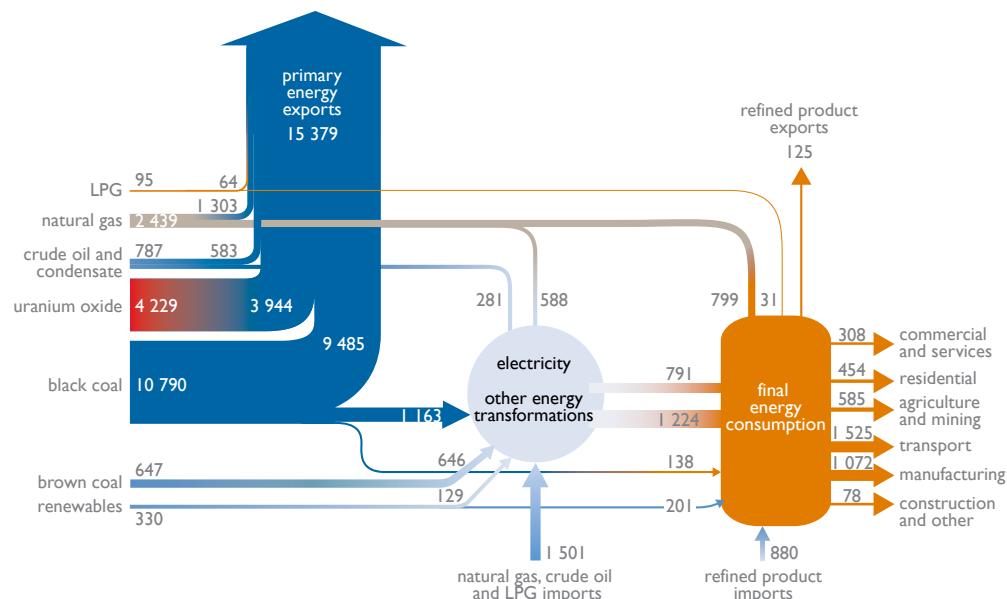

Figure E I Australian energy flows in petajoules, 2012–13

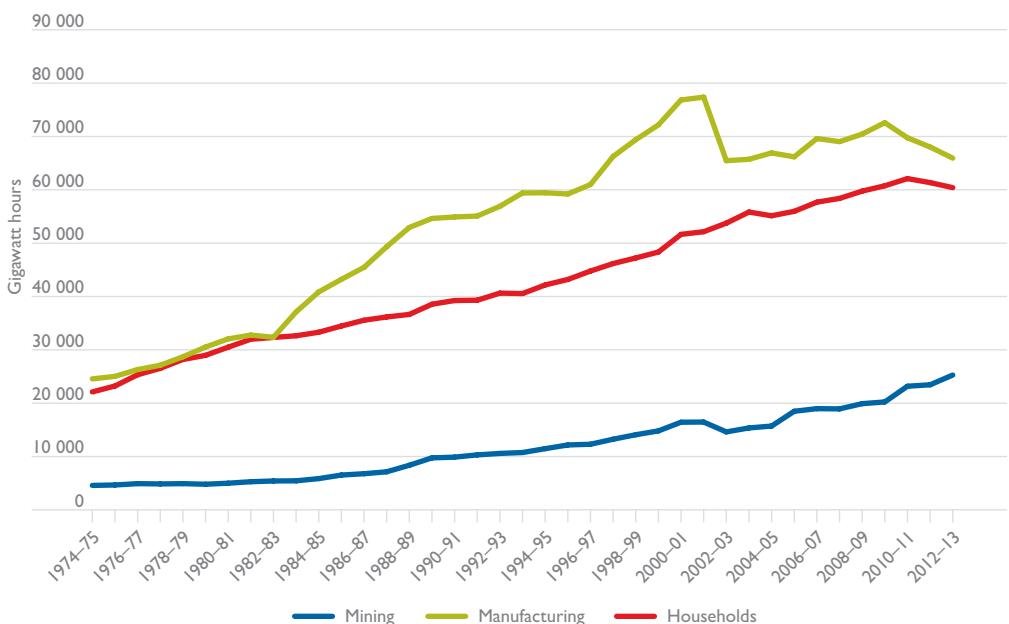

Source: reproduced with permission from BREE (2014).

PART E

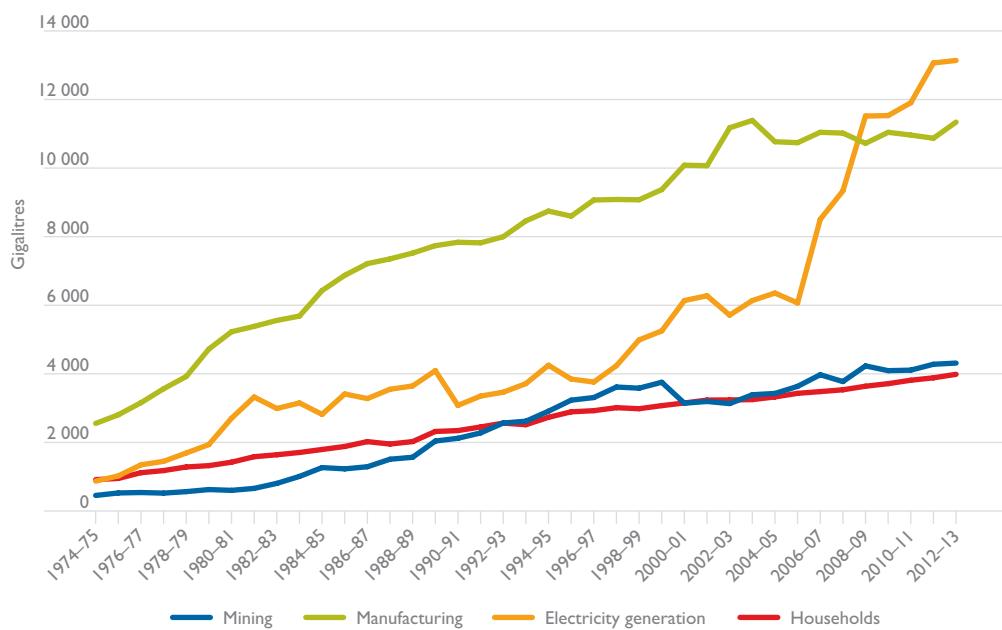

Energy

Statistics are provided for the production of energy, the conversion of primary forms of energy into electricity and the distribution of energy through electricity and gas networks.

Figure E 2 Australian electricity consumption, by broad industry

The three largest groups of electricity consumers are the manufacturing industry, households and the mining industry. The acceleration of electricity consumption by the manufacturing industry up to 2001–02 was influenced by a rapid increase in consumption by businesses manufacturing basic non-ferrous metals. Consumption by the mining industry increased significantly from 2010–11 to 2012–13 due to the mining boom.

Figure E 3 Australian gas consumption, by broad industry

The consumption of gas by the electricity generation industry increased sharply from 2006–07 to 2012–13. The growth reflected a sharp increase in gas consumption by the electricity generation industry in Western Australia and New South Wales (in the latter case, usage increased sharply in 2009–10 to 2012–13).

CHAPTER I

Energy infrastructure

^c From 1998–99, non-schedule small hydro plants are excluded from estimates.

^d From 2003–04, generation capacity of Blowering is included in NSW hydro figures, where previously they were shown in Snowy Mountains Hydro Electric Authority.

^e From 2008–09, SMHEA generation capacity is recorded by state.

Note: Data are not readily available for missing years.

Note: Figures represent commissioned scheduled and semi-scheduled generators only and exclude embedded, non-grid private generators and non-scheduled intermittent generators.

^c From 1998–99, non-schedule small hydro plants are excluded from estimates.

^e From 2008–09, SMHEA generation capacity is recorded by state.

Note: Data are not readily available for missing years.

Note: Figures represent commissioned scheduled and semi-scheduled generators only and exclude embedded, non-grid private generators and non-scheduled intermittent generators.

^c From 1998–99, non-schedule small hydro plants are excluded from estimates.

^f Prior to 2003–04, Queensland generation capacity did not include generating capacity at Mt Isa.

Note: Data are not readily available for missing years.

Note: Figures represent commissioned scheduled and semi-scheduled generators only and exclude embedded, non-grid private generators and non-scheduled intermittent generators.

^c From 1998–99, non-schedule small hydro plants are excluded from estimates.

^d The Wholesale Electricity Market commenced in WA in September 2006. From 2006–07, generation capacity includes all market generators in the SWIS with a capacity greater than 10 MW.

Note: Data are not readily available for missing years.

Note: Figures represent commissioned scheduled and semi-scheduled generators only and exclude embedded, non-grid private generators and non-scheduled intermittent generators.

^c From 1998–99, non-schedule small hydro plants are excluded from estimates.

^d From 2003–04, generation capacity of Blowering is included in NSW hydro figures, where previously they were shown in Snowy Mountains Hydro Electric Authority.

^e From 2008–09, SMHEA generation capacity is recorded by state.

Note: Data are not readily available for missing years.

Note: Figures represent commissioned scheduled and semi-scheduled generators only and exclude embedded, non-grid private generators and non-scheduled intermittent generators.

^k NGL represents natural gas liquid hydrocarbons other than methane, while LNG represents liquid natural gas (principally methane).

^l Australian energy production of uranium is measured in terms of tonnes of uranium metal equivalent, rather than ore extracted.

Note: Data are not readily available for missing years.

ⁿ From 1997–98, customer connections for ACT are included in the NSW figure.

^o The method of compiling South Australian customer numbers changed from 2003–04 and is not comparable to earlier years.

^p A breakdown of customer connections for Western Australia was not available for 2005–06. The method of compiling Western Australian customer numbers changed from 2007–08 and again in 2008–09. Estimates are not comparable to earlier years.

^q The method of compiling Northern Territory customer numbers changed from 2005–06 and is not comparable to earlier years.

^r Estimate only.

Note: Data are not readily available for missing years.

ⁿ From 1997–98, customer connections for ACT are included in the NSW figure.^o The method of compiling South Australian customer numbers changed from 2003–04 and is not comparable to earlier years.^p A breakdown of customer connections for Western Australia was not available for 2005–06. The method of compiling Western Australian customer numbers changed from 2007–08 and again in 2008–09. Estimates are not comparable to earlier years.^q The method of compiling Northern Territory customer numbers changed from 2005–06 and is not comparable to earlier years.

Note: Data are not readily available for missing years.

PART C: Communication

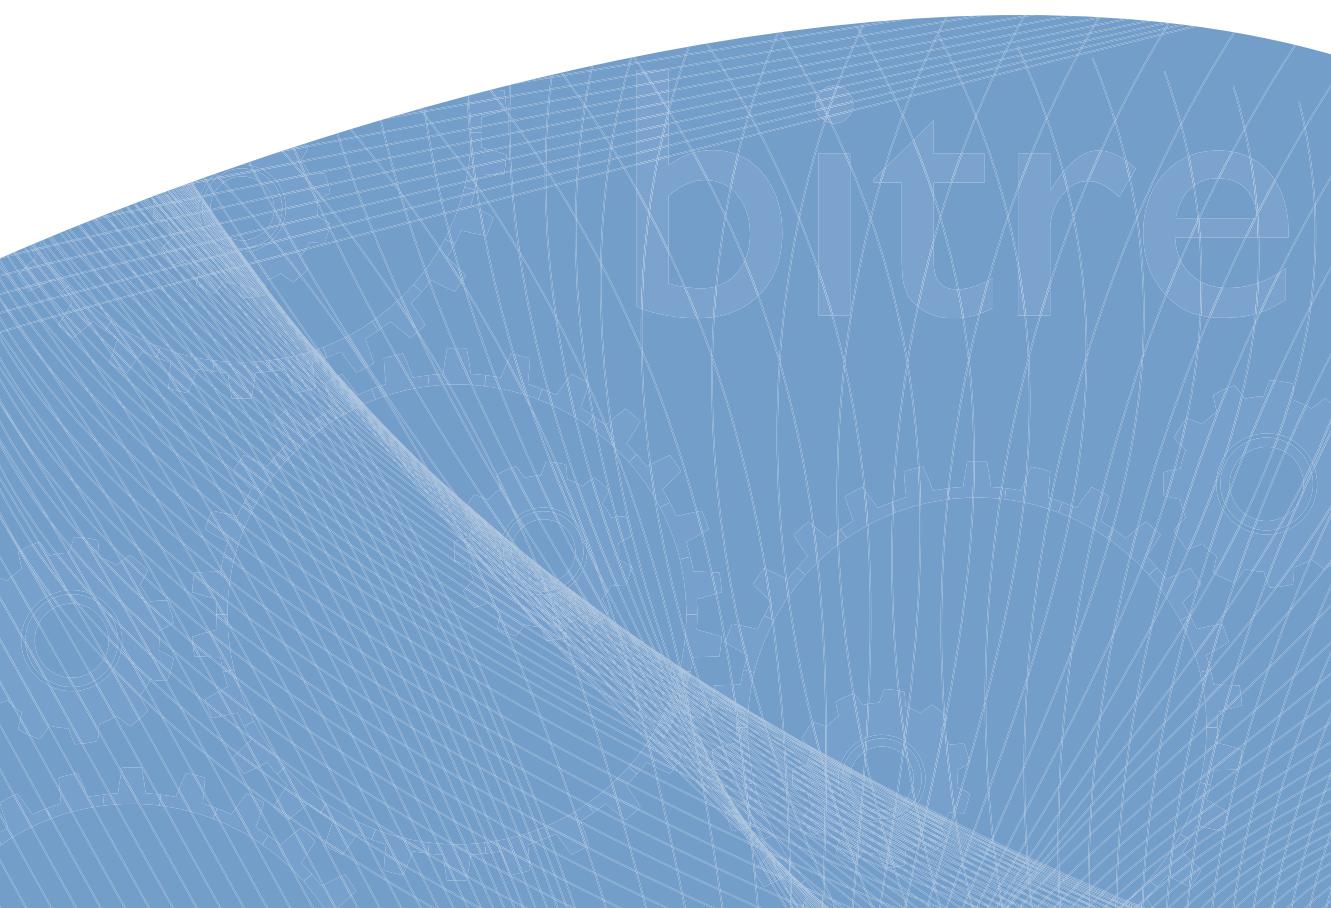

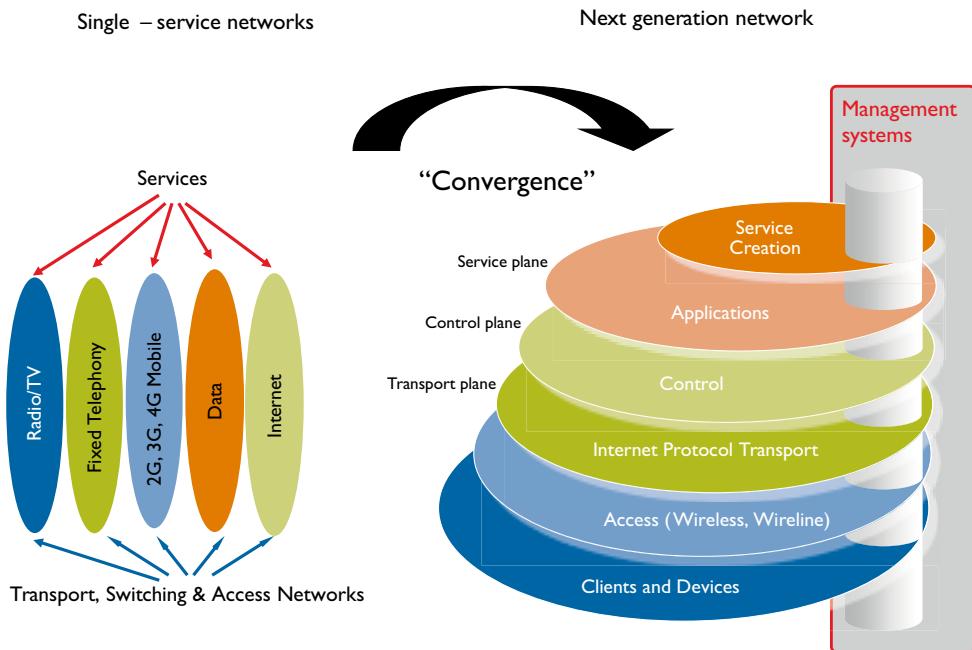

Figure C 1 Telecommunications networks: traditional and next generation

Source: Adapted from "Developments in next generation applications and services" report, *Australian Communications and Media Authority*, 2011.

PART C

Communication

The study of Australian economic infrastructure focuses on key networks that enable economic activity. Telecommunications networks are a vital part of Australian infrastructure, with communications networks now in a period of significant transition.

Traditional communications architecture was based on vertically integrated separate networks that delivered separate services over a dedicated network (see Figure C1, facing page). Modern communications networks are moving to the use of a more horizontal, next generation network architecture organised into layers of common functions, which allows the delivery of multiple services to a single user device delivered over a common internet protocol based platform.

The upper layers of the diagram (control, applications and service creation) are associated with the presentation of software-based user-focussed features and services, while the lower layers in the diagram are associated with the more physical elements of the communications process. Management systems provide overall management of network interaction between layers. The horizontal architecture allows for competition amongst industry participants operating within a layer.

The phenomenon of communications ‘convergence’ is not just occurring at the network, service and device level, but also among the previously distinct industries of telecommunications, broadcasting, radio communications and the Internet.

Readers should take these rapid developments in communications technology into account when analysing time series statistics for communications networks.

Where possible, statistics in Part C: Communication of the Australian Infrastructure Statistics Yearbook focus on physical infrastructure networks and their usage, rather than the broader communications industry. For Chapter 2, these distinctions are not possible as data are not available with sufficient detail to separately identify physical infrastructure networks.

Traditional measures of infrastructure construction activity only provide a partial picture of the capacity and usage of communications infrastructure as they only measure investment in the physical infrastructure networks. Information technology upgrades that provide additional functionality or new services on existing networks, along with network upgrades that extend geographic coverage, have been major drivers of increased infrastructure capacity in the communications industry. Chapter 2 of Part C: Communication provides estimates of investment in information technology by the information media and telecommunications industry.

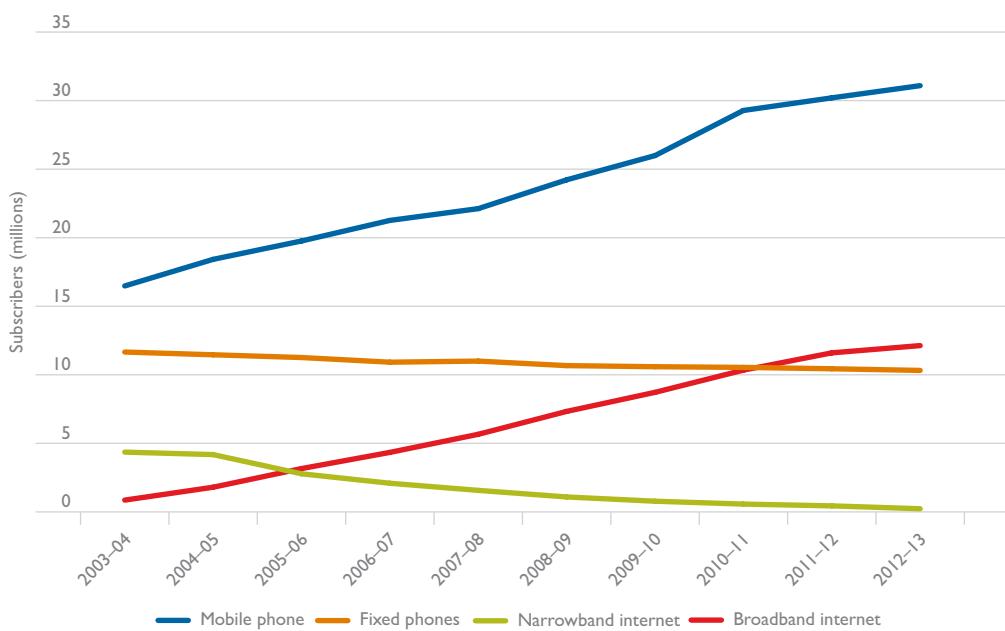

Major drivers of communications infrastructure activity over recent years have been:

- increasing international bandwidth capacity
- growth in domestic backhaul transmission capacity (infrastructure connecting access nodes to the core network)
- a broadening range of internet access technologies available, including digital subscriber line (DSL) and wireless broadband network deployments (with increasing intensity of use and reliance on radio communications spectrum allocations)
- mobile network extensions for 3G and 4G mobile services, and
- the convergence of networks, devices and service

The deployment of the National Broadband Network (NBN) represents a significant investment in a fibre optic network. This investment will be reflected in the statistics over the coming years of the NBN deployment and beyond.

An illustration of the dynamism of the communications sector; Figure C2 demonstrates the take-up of mobile phones and broadband internet over the last ten years, and the decline of the number of subscribers to the older technologies of 'narrowband' internet and fixed phones.

Figure C 2 Communications subscribers—number of subscribers, by communications medium

CHAPTER I

Communication infrastructure

^b Estimate has a relative standard error between 10% and 25%.^c Estimate has a relative standard error of 25% to 50%.^d This series groups several industries into the one measure. Relative standard errors were calculated for component series, but are not available for the new measure.^e Gross fixed capital expenditure represents expenditure on fixed assets that excludes repair and maintenance expenses, but includes all costs associated with own-account capital formation. Fixed assets include all produced assets (physical assets, cultivated assets and intellectual property products) that are used in processes of production for more than one year. Non-produced assets such as spectrum assets are not included in gross fixed capital formation.

np Not available for publication but included in total where applicable.

PART W:Water

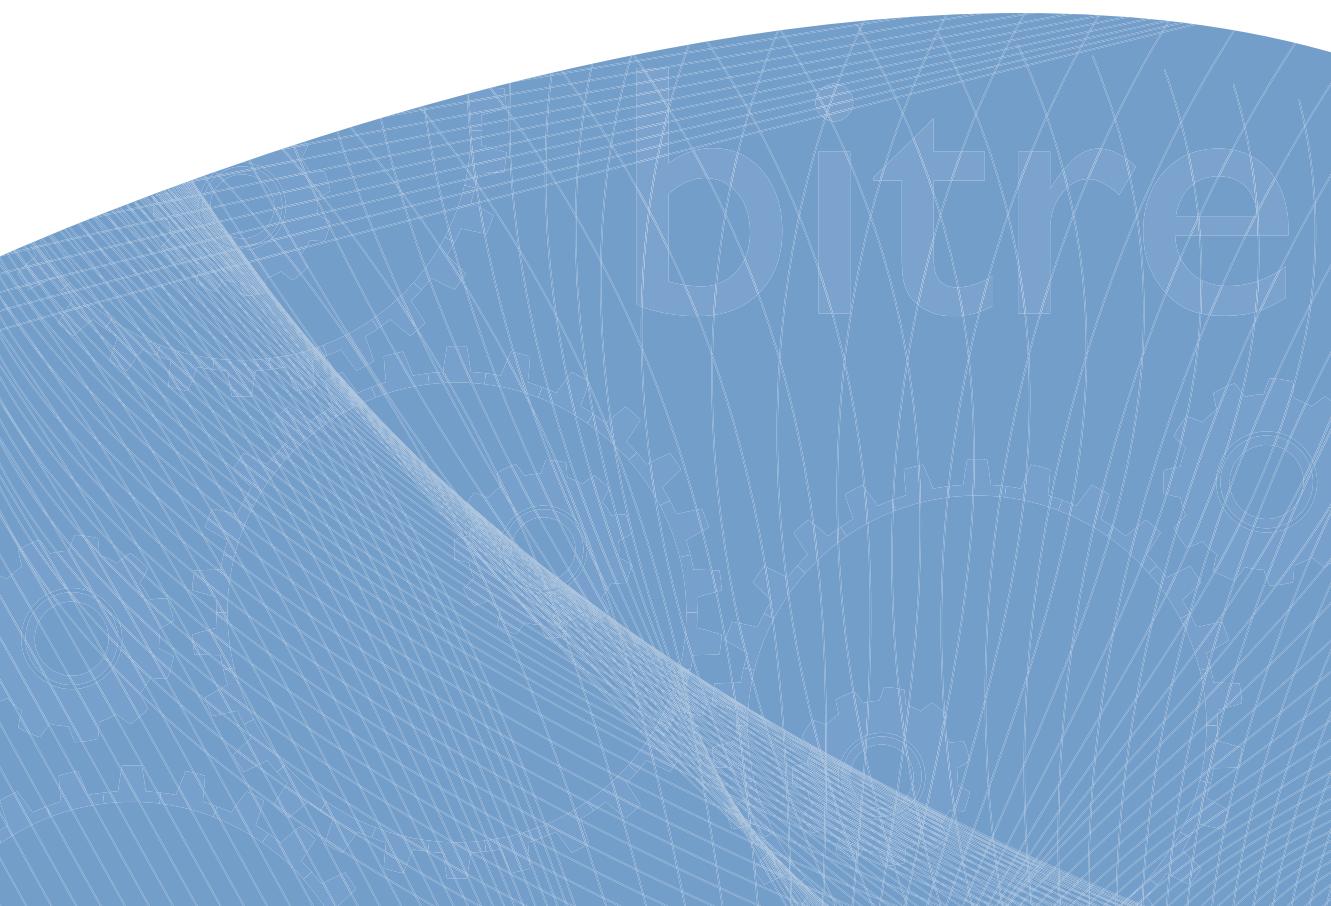

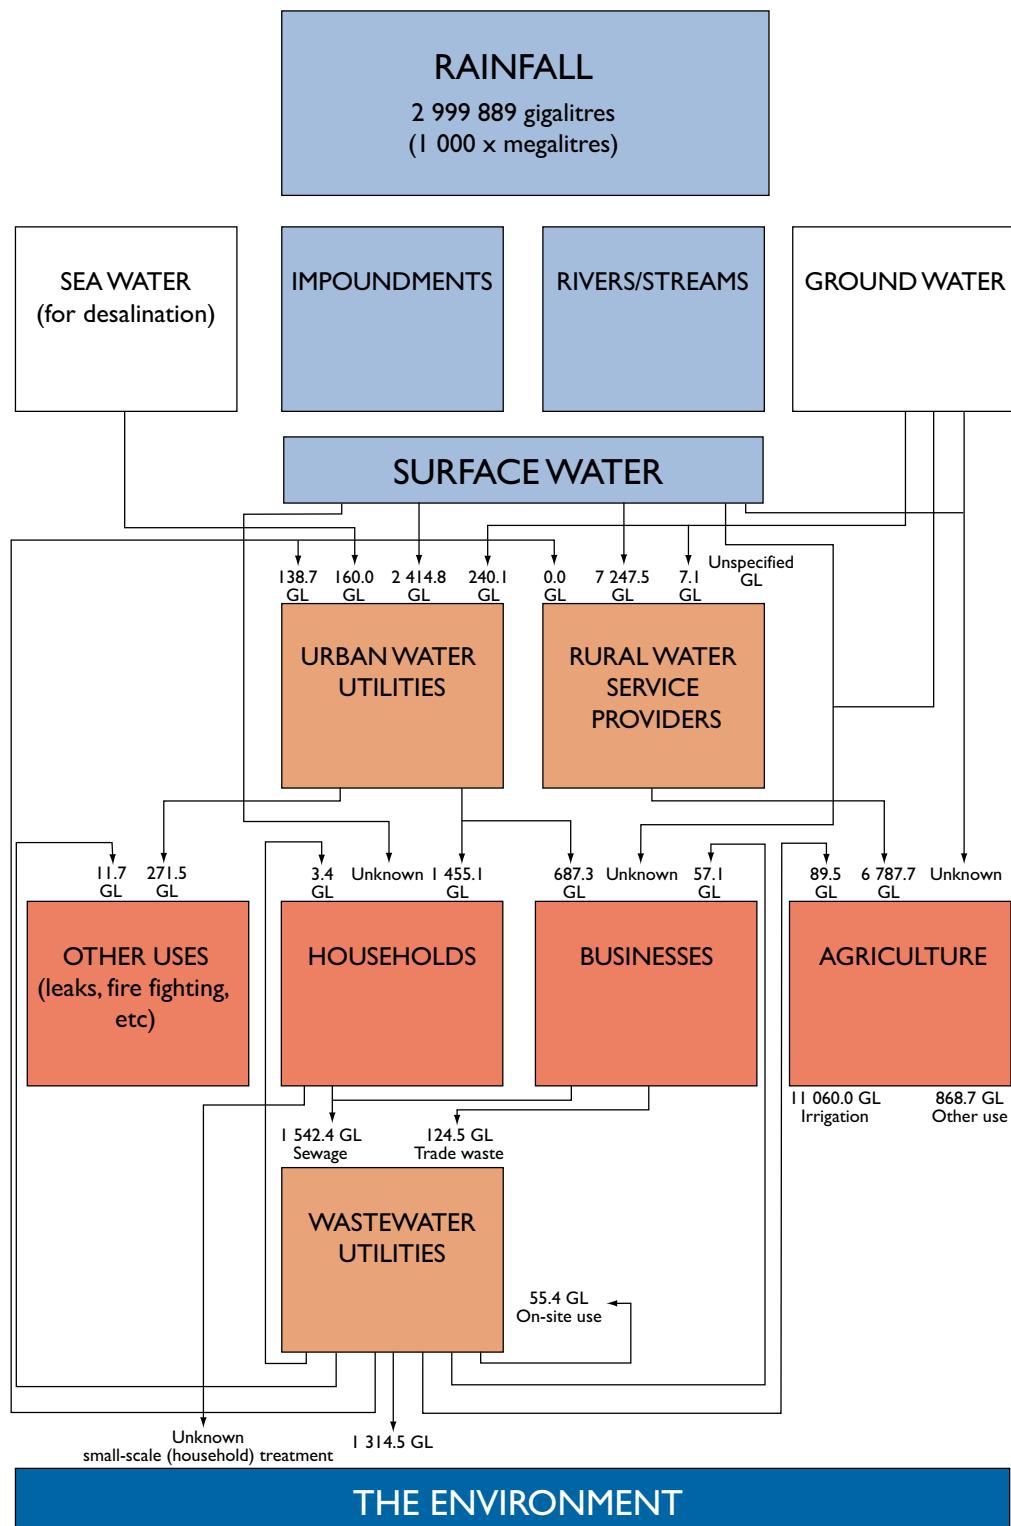

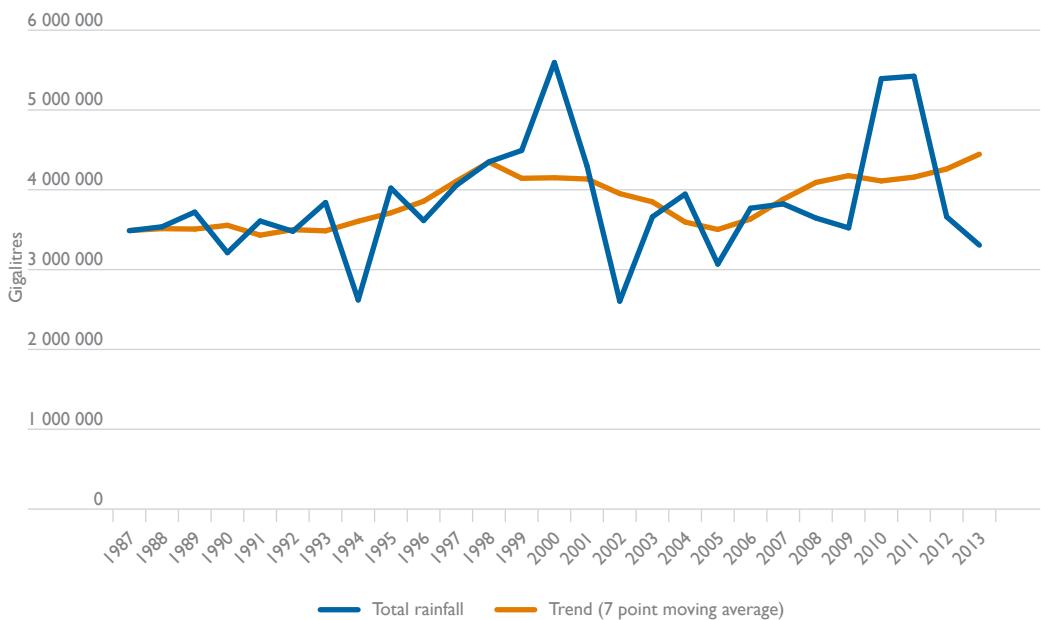

Figure W | Water: Australian sources and uses, 2012–13

PART W

Water

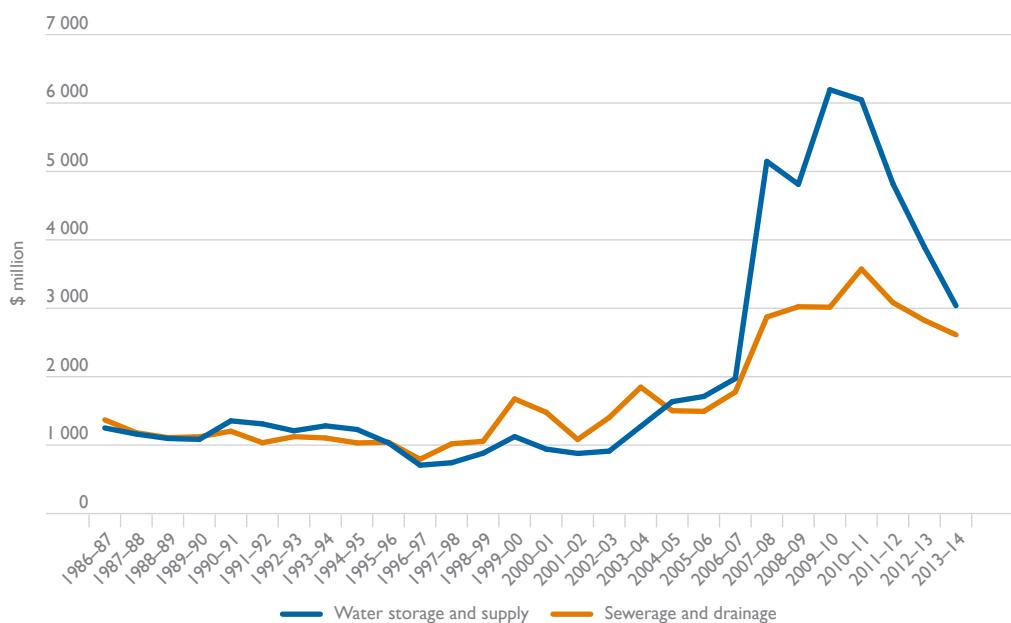

Australian water utilities use infrastructure networks to provide water to urban and rural areas and to provide wastewater collection and treatment services to large areas of the country. Part W: Water provides both physical and financial measures of water infrastructure, inputs to water supply and wastewater treatment activity, water supply and wastewater treatment activity, and measures of water health and emissions issues.

Figure W 2 Total volume of rainfall in Australia

Total rainfall is subject to significant annual variations. Rainfall was considerably higher than average in 2010 and 2011—the years in which parts of Queensland, Victoria and New South Wales were flooded. In the following two years rainfall decreased sharply to finish below trend.

Figure W 3 Water infrastructure engineering construction, adjusted by chain volume index

Infrastructure construction activity was relatively constant (in chain volume adjusted terms) until about 2002–03. Since 2003–04, water infrastructure construction expenditure has increased sharply in real terms, particularly for water storage and supply projects, which reflect construction work on the South-East Queensland water grid and the construction of a desalination plants in Western Australia, New South Wales, Queensland and Victoria. Expenditure on the construction of water storage and supply decreased with the recent completion of these projects.

CHAPTER I

Water infrastructure

Table W 1.1a Flow of new infrastructure—value of water infrastructure engineering construction work done by the private sector for the private sector, adjusted by chain volume index

End notes and definitions

End notes and definitions

This publication presents annual estimates of activity related to major Australian economic infrastructure (transport, energy, communication and water infrastructure). These estimates were compiled from a range of sources. Where possible, statistics are presented on a financial year basis (year ended 30 June). Throughout this publication, end notes are numbered consecutively within each part. To avoid duplication, an end note is explained under the heading of the table in which it first occurs.

Part I Infrastructure and the economy

Industry statistics provided in this publication are based on the Australian and New Zealand Standard Industrial Classification (ANZSIC) (ABS 2008). Industry classification is allocated to businesses based on each business' predominant activity. As such, there is a distinct difference between industry statistics and activity statistics. For example, road transport gross value added is a measure of the economic production of Australian businesses for which the provision of road transport services is the major activity. Road transportation services provided by businesses classified to other industries (e.g. delivery services provided by the retail industry) are not included in these estimates and conversely, non-transportation activities undertaken by businesses classified to the road transport industry are included in these estimates.

Table I 1.1

Gross value added is the value of output at basic prices minus the value of intermediate consumption at purchasers' prices. The term is used to describe gross product by industry and by sector:

1. Changes to current price production measures may be due to either price or volume changes. Chain volume measures are provided to allow analysis of variations in production volumes; however, component chain volume measures do not sum to a total in the way original current price components do.
2. Gross value added at basic values represents the amounts received by producers, including the value of any subsidies on products, but before any taxes on products. The difference between the sum over all industries of gross value added at basic prices and GDP at market (or purchasers') prices is the value of taxes less subsidies on products.
3. The rail, pipeline and other transport industry includes water transport.

Table I 1.2

Table I 1.2 provides estimates for total employment by major infrastructure industries in August each year, including both full-time and part-time employment.

4. From 1986, the definition of employed persons was changed to include persons who worked without pay between 1 and 14 hours per week in a family business or on a farm (i.e. contributing family workers).

Table I 1.3

Average weekly earnings statistics provide an estimate of the average weekly income of wage and salary earners in key infrastructure industries. The estimates reflect the overall level of earnings of employees and the changes in the composition of the infrastructure industries' workforce (e.g. changes to the proportions of full-time, part-time and casual employees and changes to the proportions of occupations over time).

ABS compiles average weekly earnings statistics on a quarterly basis in the Survey of Average Weekly Earnings and on a biennial basis in more detail in the Survey of Employee Earnings and Hours. The Australian infrastructure statistics yearbook provides data sourced from the Survey of Employee Earnings and Hours as the Survey of Average Weekly Earnings does not provide adequate industry detail.

5. Estimates of average weekly earnings in Table I 1.3 exclude amounts salary sacrificed (the collection of salary sacrifice amounts are a relatively recent addition to the survey). Average weekly earnings represent gross earnings (before tax, superannuation and other items are deducted).
6. Caution should be exercised when comparing data across years. The Survey of Employee Earnings and Hours is not designed as a times series. In addition, the industry classification used in compiling average weekly earnings statistics changed in 2008. Earlier industry estimates were based on the 1993 version of ANZSIC, while the 2008 estimate was compiled based on an updated (2006) version of ANZSIC.

Estimates are compiled from a sample survey of employers and are subject to sampling variability. That is, they may differ from the estimates that would have been produced if the information had been obtained from all employers. A measure of sampling error is calculated (standard error), which indicates the degree to which an estimate may vary from the value which would have been obtained from a census of all employers. There are about two chances in three that a sample estimate differs from the true value by less than one standard error and about nineteen chances in twenty that the difference will be less than two standard errors.

An example of the use of a relative standard error (standard error expressed as a percentage of the estimate) is as follows. If the estimate for average earnings is \$500 with a relative standard error of 1 per cent then there would be about two chances in three that a full enumeration would have given an estimate in the range \$495 to \$505 and about nineteen chances in twenty that it would be in the range \$490 to \$510.

Table I 1.3 includes a number of estimates that are subject to high relative standard errors (greater than 25 per cent).

Table I 1.4

The indexes provided in Table I 1.4 relate to the prices received by businesses classified to major infrastructure industries. For the transport industry, indexes are only available for freight transport and storage services. Indexes for prices received by businesses providing passenger transport services are not currently available from the ABS.

Index numbers for financial years are simple averages of the four relevant quarterly index numbers.

Table I 1.5

State and territory population estimates are classified by capital city and rest of state on the last day of the financial year (30 June). Population estimates are based on census counts for census years, and are derived and updated by adding estimates of natural increase and net overseas migration. After each census, population estimates are revised to remove discrepancies between census outcomes. In 2014, ABS revised population estimates from 2003 to 2013 which created a break in the data series between 2002 and 2003.

7. ACT capital city data include Queanbeyan (NSW) for the period 1971 to 1990.
8. Excludes Jervis Bay Territory from June 1994.
9. Data for 1991 to 1995 are based on 2001 Australian Standard Geographical Classification boundaries.
10. Data for 1995–96 onwards are based on 2006 Australian Standard Geographical Classification boundaries.
11. In June 2011 the ABS replaced the nation's official statistical geography, the ASGC with the new Australian Statistical Geography Standard (ASGS).
12. Rest of state estimates are calculated by subtracting the capital city population from the corresponding state/territory total population.

Table I 1.6

Table I 1.6 provides a number of measures of economic activity that may influence Australian infrastructure activity. Goods exports and goods imports figures provide measures of the flow of physical goods into and out of Australia, over the full financial year. The consumer price index provides a measure of annual changes in the price of consumer goods for the June quarter of each financial year, while exchange rate and interest rate data were measured in respect of the last day of the financial year (30 June).

13. The exchange rate data provided represent the \$US value of one Australian dollar.
14. The interest rate provided is the 90 day bank accepted bill rate at the close of trading at the end of the financial year (30 June).

Table I 2.1

Table I 2.1 provides estimates of engineering construction work done on major economic infrastructure by both private and public sector organisations. Estimates exclude the cost of land; the cost of repair and maintenance activity; the construction of buildings; the value of transfers of existing assets; the value of installed machinery and equipment not integral to the structure; and expenses for relocation of utility services.

Statistics are provided for the sector providing engineering construction services and the sector that is expected to own the project at the time of completion. Thus, statistics for work done by the private sector for the public sector summarise the work done by private sector engineering construction companies on projects that are owned by the public sector at the time of completion. When a project is undertaken as a Private Public Partnership (PPP) or similar arrangement, it is classified according to the expected ownership of the project at completion. PPPs may be classified as private sector even if ownership eventually resides with the public sector.

ABS provides both current price and chain volume measures for the value of engineering construction work done by the private sector for the private sector; by the private sector for the public sector; and by the public sector. Deflators for these chain volume measures were calculated by BITRE and applied to estimates for transport construction to create approximate volume adjusted estimates for transport engineering construction.

Part T Transport infrastructure

Table T I.1

Table T I.1 provides estimates of engineering construction work done on transport infrastructure, providing transport detail to the data provided in Table I 2.I. Estimates for the construction of airport runways are included in the roads and bridges measure.

Table T I.2

BITRE regularly prepares estimates of road expenditure based on unpublished ABS Government Finance Statistics (GFS) data and internal Department of Infrastructure and Regional Development data. There have been a number of methodological changes in the compilation of estimates over time, with the most significant being the ABS adoption of accrual-based accounting for GFS in 1998–99. Tables T I.2a to T I.2e provide estimates of construction and maintenance expenditure on road infrastructure by:

- each level of government from their own sources rather than the total expenditure on roads by that level of government;
- the non-public sector; and
- national aggregates for the Non-financial Public Sector which includes expenditure by Public Non-Financial Corporations (PNFC).

The GFS Government Purpose Classification (GPC) code 121 is used for state government road expenditure. From the 2014 issue of the yearbook GPC 1219 (Road transport n.e.c.) is included in the calculation for all years where previously it was excluded—this has increased the values reported in this issue compared to previous years. Entries in this category relate to road construction and maintenance not elsewhere classified. Economic Type Framework (ETF) category 2221 (Purchase of new non-financial assets) is also included (ABS 2014f). GPC 1211 (Aboriginal community road transport services) remains excluded from the calculation. The GFS expenses categories which are excluded are: 123 (Depreciation and amortisation) and 126 (Property expenses).

Estimates are adjusted for inflation and presented at constant 2012–13 prices calculated using the BITRE Road Construction and Maintenance Price Index (BITRE 2013).

Table T I.3

This table provides estimates of selected road-related taxes and charges in current prices. The table is not comprehensive as it excludes Fringe Benefit Tax (FBT) on vehicles, and Goods and Services Tax (GST) on motor vehicle purchase, maintenance and vehicle fuel consumption. It is difficult to estimate road-related FBT and GST because these items in recent years are aggregated, in official reports, with other non-road related items.

Commonwealth road-related revenue comprises of petroleum products excise and Federal Interstate Registration Scheme. Estimates of petroleum products excise are based on a combination of sources including Australian Taxation Office's Taxation Statistics and Commonwealth budget papers. The figures are net of any rebates to industry and are modified using ABS survey of motor vehicle usage to net out excise on products for off-road vehicle movement.

State and Territory Government road-related revenues estimated are vehicle registration fees, driver license fees and stamp duty on vehicles. The first two items are based on data supplied by relevant state and territory agencies. Data on stamp duty are from ABS Taxation Revenue Australia (ABS cat. no. 5506.0)

The time series on tolls is constructed from various sources including: annual reports of the NSW Roads and Maritime Services (and its predecessors) and Transurban at <<http://www.transurban.com>>. The table covers the following toll roads: Sydney Harbour Tunnel (M1), Eastern Distributor (M1), Sydney Harbour Bridge (M2), Lane Cove Tunnel (M2), Hills Motorway (M2), Western Motorway (M4), South Western Motorway (M5), Westlink (M7), Cross-City Tunnel, M4/M5 cashback scheme CityLink, EastLink, Logan and Gateway Motorways, Clem Jones Tunnel and Go Between Bridge.

T 1.4

1. Lengths are derived from the digital PSMA road layer centrelines and are estimates only. Changes to PSMA data from year to year, including but not limited to resolution and classification schema, may cause discontinuities in the series.
2. State boundaries are derived from the 2011 Australian Statistical Geography Standard (ASGS) (ABS, 2011). Urban/non-urban estimates are based on ASGS Significant Urban Areas.
3. Busway lengths are not available for 2010 and 2011 because PSMA did not classify 'Busway' as a road type until 2012.
4. Reported road lengths represent approximate total route-kilometres. Dual carriageway section lengths are the approximate length of the centreline between each carriageway. PSMA data was used to determine dual carriageway lengths for New South Wales, Victoria, South Australia, Tasmania and the Australian Capital Territory. Due to limitations in the PSMA data, OpenStreetMap data was used to estimate dual carriageway lengths for Queensland and Western Australia. Dual carriageway estimates derived from OpenStreetMap data are typically larger than equivalent PSMA estimates, and may vary more from year to year. Estimation of dual carriageway length was not necessary for Northern Territory or Other Territories.
5. Local roads are defined as 'roads providing property access, or distributing traffic between properties and the arterial network', in line with PSMA classifications. Note that this differs from 'LGA-managed roads', the definition more commonly used by state and local road authorities, the Australian Local Government Association (ALGA) and previous BITRE publications.

6. Roads designated as either 'access only', of undetermined type, for non-vehicular use, or which are not openly accessible to the public (limited-access) are excluded from the road length counts. These include fire trails, forestry roads, military roads, agricultural and mining access and haulage roads, private driveways, bike paths and walking trails. Busways are a special case: limited-access busways are included. Tollways are not considered to be limited-access roads. The proportion of limited-access roads is determined from PSMA data in 2012 and 2013; an estimate is used for 2010 and 2011.
7. The decline in total road length in 2012 and 2013 is driven by a reclassification of several Queensland local roads as 'Undetermined', excluding them from the count. This effect reduced Queensland's non-urban local road total by an estimated 1,100 kilometres in 2011 (relative to 2010), a further 1,900 kilometres in 2012, and another 3,500 kilometres in 2013 (a cumulative effect of approximately 6,500 kilometres in the period 2010–2013).
8. These estimates are not directly comparable to the road lengths reported in the 2013 Infrastructure Yearbook, as the methodology has changed.

Table T 1.5

Table T 1.5 includes a mix of indexes from ABS and BITRE sources. ABS Producer Price Indexes (ABS 2014l) for Australian road and bridge construction commence in September 1997 (base of index 2011–12 = 100), with state data only available from September 1998 for New South Wales, Victoria, Queensland, South Australia and Western Australia. The ABS does not publish road and bridge construction indexes for Tasmania, the Northern Territory or the Australian Capital Territory. The ABS Producer Price Index series is provided quarterly. Estimates provided in Table T 1.5 are a mean of the four relevant quarters.

Table T 1.6

From the 2014 issue of the yearbook BITRE publishes estimates of expenditure on rail infrastructure based on unpublished ABS Government Finance Statistics (GFS) data and internal Department of Infrastructure and Regional Development data. Tables T 1.6a to T 1.6d provide estimates of construction and maintenance expenditure on railway infrastructure:

- by Commonwealth and State/Territory government from their own sources rather than the total expenditure on rail by that level of government; and
- national aggregates for the Non-financial Public Sector which includes expenditure by Public Non-Financial Corporations (PNFC). An example of a PNFC in the included in the rail expenditure aggregate is the Australian Rail Track Corporation (ARTC).

The GFS Government Purpose Classification (GPC) code 123 is used for state government road expenditure. Economic Type Framework (ETF) category 2221 (Purchase of new non-financial assets) is also included (ABS 2014f). The GFS expenses categories which are excluded are: 123 (Depreciation and amortisation) and 126 (Property expenses).

It should be noted that in state expenditure table T 1.6b the difference between the expenditure totals for Non-financial Public Sector and General Government (GG) will not equal the expenditure total for Public Non-Financial Corporations, due to the existence of payments from General Government to Public Non-Financial Corporations. The sum of Public Corporations and Total Government in tables T 1.6c and 1.6d will not add to Total Public Sector for the same reason.

Table T 1.6b, which presents net state rail expenditure, contains some negative values. This is due to some mismatch between Commonwealth expenditure, and reported state expenditure from the ABS GFS. Issues include some state expenditure being reported under GPC code 128 (Other Transport) which includes GPC 1281 (Multi-model Urban Transport).

Estimates adjusted for inflation and are presented at constant 2012–13 prices calculated using the ABS Gross Domestic Product deflator with June quarter 2013 as the base period (ABS 2014b).

Domestic freight transport

Tonne kilometres (TKM) is a measure of freight task. It is measured as the number of tonnes moved by a vehicle multiplied by the distance the load travelled in kilometres. Individual trips are aggregated to provide estimates for total TKM by mode.

Road Freight

The aggregate road freight estimates in this chapter are modelled by BITRE based on estimates from the Survey of Motor Vehicle Use (SMVU) by the Australian Bureau of Statistics (ABS 2013d). The SMVU is not designed for time series usage, with the sample design and survey methodology changing several times since the survey commenced in 1963. In addition, the survey was only conducted annually between 1998 and 2007 (the survey was undertaken approximately triennially between 1971 and 1995, and biennially since 2007, although experimental estimates were modelled for 2008).

BITRE modelling modifies SMVU estimates to enable time series analysis by adjusting estimates to a common reference period, interpolating data for years when the survey was not conducted and imposing consistency requirements between SMVU and related data from other sources. An analysis of data discrepancies was undertaken in a joint ABS/BITRE project and published in an ABS research paper, Survey of Motor Vehicle Use—An investigation into coherence (ABS 2006a). A detailed description of BITRE modelling techniques for freight data is provided in Freight Measurement and Modelling (BTRE 2006a).

Rail Freight

From 2001 to 2003, the ABS published estimates of Australian rail freight in Freight Movements, Australia (ABS 2002) and Rail Freight Movements, Australia, Summary (ABS 2004). These data have been used in BITRE modelling to estimate the tonne kilometres moved by rail for 1970–71 through to 2001–02. Estimates of total tonnes moved by rail and tonne kilometres moved for 2002–03 to 2006–07 were based on the results of the 2007 Australian Rail Survey as published in the Australian Rail Industry Report 2007 (ARA 2008). The Australasian Railway Association Inc commissioned the Apelbaum Consulting Group to prepare the report. The Australian Rail Industry Report 2007 provides measures of bulk and non-bulk freight based on definitions that differ from BITRE models and, therefore, are only included in estimates of total rail freight in this publication. Estimates for state rail freight are derived from the Australian estimates using BITRE models (BTRE 2006a).

9. From the 2007–08 financial year, BITRE expanded the scope of direct collection activities to include businesses for which rail transport was not their primary activity (eg. large mining companies). Previously this information had been estimated using data from other sources. Recent estimates should not be compared with earlier data.
10. Estimates of tonne kilometres moved by rail for 2010–11 and 2011–12 are based on the Australian Rail Industry Report 2012 (ARA 2013). Data from 2007–08 to 2009–10 are taken from TrainLine 1 (BITRE 2012c). The calculation methodologies differ between publications.

Air Freight

For some time, estimates have only been available in respect of Australia's international air freight tonnage (Table T 6.2). BITRE recently commenced data collection of domestic air freight statistics (Table T 2.1 and Table T 6.3). Air freight statistics are compiled from surveys undertaken by the Aviation Statistics Unit of BITRE.

Sea freight

Australia's international freight task relies heavily on shipping in terms of tonnage moved, with all of Australia's international trade in bulk commodities transported by sea. Specific bulk shipping statistics are not readily available. For some time BITRE estimated bulk sea freight under the assumption that all non-liner freight transport was for bulk commodities (non-liner cargo consisted of all dry and liquid bulk cargo, but also comprised cargo not shipped on regular liner services such as charters, dedicated car carriers and passenger ships). Liner/non-liner statistics are no longer available from ABS.

Tables T 2.1–T 2.5

Measures of domestic freight moved by mode are provided in terms of tonnes moved and tonne kilometres, where data are available. State and territory estimates of road freight relate to the state or territory of vehicle registration, or in the case of sea freight, the state or territory of loading.

11. The total road freight estimates in Tables T 2.2a and T 4.5 differ slightly because they were derived from independent methodologies. The main difference between the series is that the estimates in Table T 4.5 net out the transport of 'tools of trade'.

Passenger transport

Passenger kilometres (PKM) is a measure of total passenger travel. It is the number of kilometres travelled by a vehicle multiplied by the number of occupants in the vehicle. Individual trips are aggregated to provide estimates for total PKM.

Tables T 3.1–T 3.2

BITRE modelling uses data from a range of sources to provide a consistent time series of Australian passenger travel (PKM). Estimates of air passenger travel (Table T 3.1) differ from

survey results for revenue passenger travel on domestic airlines (Table T 6.3) as Table T 3.1 is derived from a statistical model that creates estimates for all motorised modes of passenger transport. Vehicles not classified to passenger cars, buses, rail or air are included in 'other transport mode' (Table T 3.1).

I2. The other transport mode represents primarily non-business use of light commercial vehicles (with contributions from motorcycles, non-business use of trucks and ferries).

For intercapital city passenger travel, estimates of the land based component include travel between origin and principle destination, while the aviation component includes all travel between city pairs.

Table T 3.3

These estimates were made for Estimating Urban Traffic Congestion Cost Trends for Australian Cities (BTRE 2007) and have been updated using BITRE models. Estimates of passenger kilometres travelled in commercial vehicles primarily represent non-business use of light commercial vehicles. Data for cars, light commercial vehicles and motorcycles were drawn from successive Surveys of MotorVehicle Use. Data on rail, light rail and buses up to 2000 were drawn from quarterly surveys of state authorities and stored on BITRE transport indicators database.

Table T 3.4

Method of travel to work statistics are compiled every five years as part of the Population Census conducted by the ABS. These statistics show the method used to travel to work on the day of the Census by the entire Australian working population, attributed to the state or territory where each worker spent Census night.

I3. Public transport and other method refers to the total number of persons who used more than one method of travel for the day which included bus or trains.

Road

Vehicle kilometres travelled (VKT) is a measure of the total distance travelled by vehicles in a year.

Map T 4.1

A map of the National road network is provided. The National road network follows Australia's national land transport plan, linking cities, regions and communities.

Table T 4.1

Intercapital road distances are calculated from capital city GPO to capital city GPO using the shortest route as provided by whereis.com.au.

Tables T 4.2–T 4.5

Estimates for motor vehicle usage are modelled by BITRE, primarily from data compiled by the SMVU (ABS 2013d). In addition to the SMVU, modelling of passenger transport also incorporates fuel use statistics from the monthly Australian Petroleum Statistics published by the Bureau of Resources and Energy Economics (BREE). Freight Measurement and Modelling (BITRE 2006a) provides an outline of modelling techniques used for freight estimation, while Greenhouse Gas Emissions From Transport (BITRE 2002 and 2006b) provide an outline of modelling techniques used for passenger estimation.

Table T 4.6

The Australian motor vehicle producer price index reflects movements in the prices received by manufacturers for new motor vehicles. The motor vehicle retail price index reflects the prices consumers pay for new and used motor vehicles and vehicle hire and lease expenses (non-holiday). The other indexes in this table reflect changes in the prices consumers pay for a range of motor vehicle goods and services

Tables T 4.7–T 4.8

The ABS Motor Vehicle Census (ABS 2014k) is a census of all vehicles registered for use on public roads, excluding vehicles registered as vintage or historical cars, military vehicles and consular vehicles (in New South Wales, vintage or historical cars cannot be separately identified and are included in census results). The census date is 31 March each year, although this has varied in previous years (care should be taken when comparing movements over years). From 1991 onwards, data are not strictly comparable with previous surveys due to revisions to Australian Design Rules, which had an impact on the way vehicles were classified in ABS statistics:

- The classification of rigid trucks is restricted to only vehicles with a gross weight of 3.5 tonnes or more. Vehicles that had previously been classified as rigid trucks with a gross weight of less than 3.5 tonnes are classified as light commercial vehicles under the new standards.
- The classification of buses is restricted to only vehicles with seating for 10 passengers (including driver) or more. Vehicles that had previously been classified as buses with seating for less than 10 passengers are classified as passenger vehicles under the new standards.

Data from the Motor Vehicle Census are not available with a state disaggregation prior to 1982.

Tables T 4.9–T 4.10

Data for new motor vehicle sales are sourced from the Federal Chamber of Automotive Industries and presented in Sales of New Motor Vehicles, Australia (ABS 2014n). The scope of these statistics is different to motor vehicle registrations data (Tables T 4.7–T 4.8) as it may include defence force vehicles, consular vehicles and vehicles that are intended for off-road use that are not registered for use on public roads. New motor vehicle sales statistics do not include sales of new motor cycles.

Tables T 4.11

14. Licence count data include driver licences with an active status. They do not include driver licences with the following status;

- Cancelled;
- Surrendered;
- Expired; or
- Disqualified.

Provisional and learner driver permits are included in licence counts.

Licence count data also include other classes of car licences, so are not directly comparable to data in Table 4.12. Caution should also be taken when comparing licence counts between jurisdictions due to small differences in the classification of “active” licences.

Total licence holder counts include licences where gender is not specified or not recorded as male or female.

Tables T 4.12

15. Licence count data include driver licences with an active status. They do not include driver licences with the following status;

- Cancelled;
- Suspended;
- Surrendered;
- Expired;
- Disqualified; or
- Restricted.

Where someone holds a car licence and a heavy vehicle licence, this is counted twice. Any heavy vehicle category between the car category and highest heavy vehicle category held is not counted.

For example, for full heavy combination (HC) licence holders, the following counting rules apply:

- Full Car Licence—(counted)
- Light rigid (not counted)
- Medium Rigid (not counted)
- Heavy rigid (not counted)
- Full Heavy Combination—(counted)

Where someone holds a full car licence and a full motorcycle licence, this is counted twice. Where a customer holds a car, motorcycle and truck licence, this is counted three times.

Provisional licence counts include all sub classes of provisional licence (e.g. P1 and P2 car licences)

WA Licence data by class are not available.

Rail

Table T 5.1

Intercapital rail distances can vary significantly depending on whether the distances are measured between freight terminals or passenger terminals and on the route chosen. The freight and passenger terminals used in compiling Table T 5.1 are provided below:

Sydney:

- Chullora South Junction (for the Chullora freight terminal).
- Sydney Central Railway Station (for regional and interstate passengers).

Melbourne:

- Tottenham Junction (for Tottenham yard, Dynon terminals and the Port of Melbourne).
- Southern Cross Railway Station (Spencer Street) for regional and interstate passengers.

Brisbane:

- Acacia Ridge freight terminal.
- Roma Street Railway Station for regional and interstate passengers.

Adelaide:

- Dry Creek South freight yards.
- Adelaide—Parklands Terminal (Keswick) for interstate passengers.

Perth:

- Forrestfield freight yards.
- East Perth for regional and interstate passengers.

Darwin:

- East Arm Wharf.
- Darwin Railway Station, Berrimah, for interstate passengers.

Canberra:

- Railway lands adjacent to railway corridor, Queanbeyan—Canberra (Fyshwick).
- Canberra Railway Station, Kingston.

Where more than one route exists between capital cities, the route chosen is the one that is typically used by the given train type. Some city pairs do not have point-to-point services so routes have been assumed. The following routes have been used:

Cootamundra/Parkes route for:

- Sydney—Adelaide/Perth/Darwin freight
- Brisbane—Perth/Darwin freight
- Canberra—Perth/Darwin freight

Lithgow/Parkes route for:

- Sydney—Adelaide/Perth/Darwin passenger
- Brisbane—Adelaide/Perth/Darwin passenger

Melbourne route for:

- Brisbane—Adelaide freight
- Canberra—Adelaide

For the Brisbane—Melbourne passenger terminal calculations, the distance is calculated via North Strathfield and Granville, bypassing Sydney Central.

Table T 5.2

16. “Open” railways include heritage railways; “mothballed” lines (that is, lines with no scheduled or unscheduled services) are excluded. Also excluded are Queensland narrow-gauge (610 mm) sugar tram lines—estimated to be around 4 000 route-kilometres.
17. Railway route length refers to lines that are operational. The reduction in route length between 2013 and 2014 is primarily due to the closure of some grain lines in Western Australia. Small changes also occurred in other states, primarily due to the mothballing of some regional lines. There are ongoing discussions among interested parties to re-open a number of grain lines in Western Australia as well as the Demondrille—Greenthorpe/Blayney lines in NSW.

Table T 5.3

- Sydney’s metropolitan network is defined here as being bounded by Waterfall, Macarthur, Emu Plains, Richmond and Berowra.
- Melbourne’s metropolitan network is defined here as being bounded by Stony Point, Sandringham, Williamstown, Werribee, Sunbury, Flemington Racecourse, Craigieburn, Upfield, South Morang, Hurstbridge, Lilydale, Belgrave, Alamein, Glen Waverley, Pakenham and Cranbourne.
- Brisbane’s metropolitan network is defined here as being bounded by Caboolture, Shorncliffe, Domestic Airport, Doomben, Cleveland, Beenleigh, Rosewood, Springfield Central and Ferny Grove.
- Perth’s metropolitan network is defined here as being bounded by Midland, Armadale, Thornlie, Mandurah, Fremantle and Clarkson.
- Adelaide’s metropolitan network is defined here as being bounded by Belair, Tonsley, Seaford, Grange, Outer Harbor and Gawler Central.

Aviation

Table T 6.1

Intercapital air distances are provided in terms of greater circle distances. These are distances that take into account the curvature of the earth.

Tables T 6.2–T 6.3

18. Revenue passengers are fare paying passengers uplifted from or discharged in Australia.
19. Number of international revenue passengers uplifted from or discharged in Australia as well as passengers carried via Australia by Qantas and Emirates (from November 2011) divided by the number of available seats.
20. Revenue passenger kilometres are calculated by multiplying the number of revenue passengers travelling on each flight stage by the distance in kilometres between the airports. Modelled estimates of air passenger travel (Table T 3.1) differ from survey results for domestic airline revenue passenger travel.
21. Domestic revenue passenger kilometres divided by available seat kilometres.

Table T 6.4

22. Regular Public Transport (RPT) operations only. RPT is aircraft transport available to the public and operated to fixed schedules and between specified fixed terminals.

Table T 6.5

Airline on time measures are provided in terms of on time departures (flights that depart within 15 minutes of the scheduled departure time), on time arrivals (flights that arrive within 15 minutes of the scheduled arrival time) and cancellations (flights cancelled or rescheduled within seven days of the scheduled departure time).

23. Participating airlines are Jetstar, Qantas, QantasLink, Regional Express, Tigerair, Virgin Australia and Virgin Australia Regional Airlines.

Table T 6.6

Airfare indexes provided are the annual average of monthly indexes compiled by BITRE.

Shipping

Deadweight tonnage (DWT) is the measure of weight that a vessel can carry, including cargo, bunkers, water and stores, expressed in tonnes.

Table T 7.1

The main source of information on intercapital sea distances was The Ports of Australia (Australian Chamber of Shipping 1993). Where optional routes are available, the shorter distance was used.

Tables T 7.2–T 7.3

Tables T 7.2 and T 7.3 provide estimates of the number of ships that visit major ports or states and the number of vessel visits a port or state receive during a financial year.

24. Improvements have been made to the methodology used to compile estimates of port calls, with revisions back to 1998–99.
25. From 2002–03 numbers include only cargo ships.

Table T 7.4

Data for international sea freight was compiled by BITRE from ABS international cargo statistics that were provided to the ABS by Australian Customs. The classification of cargo to bulk or non-bulk categories was an approximation based on the ship type. Liners were assumed to be non-bulk carriers and non-liners were assumed to be bulk carriers.

Liners carry mostly containerised, roll-on roll-off, and general cargo. They operate on a fixed schedule between specified ports and accept cargo from all sources. Non-liner cargo includes all dry and liquid bulk cargo as well as cargo not carried on regular liner services.

26. Since 2008–09, bulk and non-bulk categories are no longer available from ABS International cargo statistics. Numbers provided from 2008–09 are BITRE estimates.

Tables T 7.5–T 7.7

Tables T 7.5, T 7.6 and T 7.7 provide estimates of the tonnes of cargo loaded or discharged from ships at Australian ports. Domestic cargo is recorded in these estimates at both the port of loading and the port of discharge, while international cargo is recorded only at the Australian port of loading or discharge.

27. International Trade cargo statistics are no longer available, so merchandise trade data have been used and back-cast to 2005–06 for comparative purposes. Merchandise trade data have a different scope to the previously used cargo statistics with one of the differences being the inclusion of exports' ship and aircraft stores. The timing of the data supply has also changed to now include fully revised data.
28. Port throughput data may differ slightly from data reported directly by port authorities.

Table T 7.9

Table T 7.9 provides the number of ships operating out of Australian ports for at least part of the financial year that are owned or operated by Australian entities. In any financial year, there may be ships managed by Australian registered companies that operate internationally without calling into Australian ports.

Tables T 7.10–T 7.11

A list of the major Australian registered trading vessels (greater than 2000 dwt) engaged in Australian coastal and international trade is provided in Tables T 7.10 and T 7.11. Vessels are classified to coastal or international trade based on their primary activity. Some predominantly international trading vessels occasionally engage in coastal trade and some predominantly coastal trading vessels occasionally engage in international trade.

Safety

Fatalities include injuries resulting in death within 30 days of the accident where death is attributable to injuries sustained during the accident.

Serious injuries are defined as injuries that require hospitalisation.

Table T 8.1

Table T 8.1 provides a cross-modal comparison of fatality accidents and fatalities. Road statistics are compiled by BITRE, while marine and aviation statistics are compiled by the Australian Transport Safety Bureau (ATSB), and rail statistics are compiled by the Office of the National Rail Safety Regulator (ONRSR). Data are not currently available for the number of rail fatality accidents.

Marine accident and fatalities statistics only include occurrences reported to ATSB which take place in Australia's maritime jurisdiction. They include accidents and other safety incidents involving Australian registered trading vessels (cargo and/or passengers) and trading vessels flying foreign flags. They also include injuries on board recreational and fishing vessels drawn into accidents that also involved a ship.

Marine accidents are defined as an occurrence involving a vessel where:

- A person dies or suffers serious injury as a result of an occurrence associated with the operation of the vessel; or
- The vessel is destroyed or seriously damaged as a result of an occurrence associated with the operation of the vessel; or
- Any property is destroyed or seriously damaged as a result of an occurrence associated with the operation of the vessel (Transport Safety Investigation Act 2003).

Cross-modal comparisons should be undertaken with caution as level crossing accidents between trains and road vehicles are included in the estimates of both modes from 2001 (level crossing deaths were not included in rail fatality statistics prior to 2001). In addition, suicides are excluded from aviation casualty estimates and road estimates but included in rail estimates from 2001 to 2011.

Tables T 8.2–T 8.9

Fatality rates and serious injury rates are presented for each mode using population data provided in Table I 1.5 and passenger kilometre data provided in Table T 3.1.

29. Between 1989 and 1997, statistics for serious injuries resulting from road accidents were based on statistics compiled from police accident reports. Comparable national statistics are no longer available from these sources.
30. From 2000–01, serious injury statistics for roads are compiled on a financial year basis (year ended 30 June) from hospital records provided to the Australian Institute of Health and Welfare and maintained on their National Hospital Morbidity Database.

Tables T 8.10–T 8.12

Rail safety statistics are sourced from the Office of the National Rail Safety Regulator (ONRSR) and QLD and WA state rail regulators. SA, NT, TAS, and NSW data are provided by the ONRSR. Historic NSW and VIC data are sourced from:

- The Independent Transport Safety Regulator (ITSR) under a service level agreement with the ONRSR (for data pre-20 Jan 2013).
- Transport Safety Victoria under a service level agreement with the ONRSR (for data pre-19 May 2014).

QLD data are provided by the Department of Transport and Main Roads (QLD), WA data are provided by the Office of Rail Safety, Department of Transport (WA) and ACT data are included in the NSW counts.

Rail occurrence data for 2012 onwards include only heavy rail (excluding tram, non-heavy rail tourist and heritage operators) operations. Fatality and serious injury data excludes suspected suicide and trespass.

31. NSW records occurrences where transfers by ambulance were required (excluding a person being transported for non-rail safety related health reasons, e.g. heart attack, seizure) as proxies for serious injuries. Consequently, this information has been provided separately.

32. ACT rail fatalities are recorded under NSW.

The data are based on information provided by rail operators. The ONRSR cannot guarantee the accuracy or completeness of information provided by third parties.

Tables T 8.13–T 8.15

Aviation accident statistics include all occurrences associated with the operation of an aircraft which take place between the time any person boards the aircraft with the intention of flight until disembarking, in which a person is injured as a result of:

- being in the aircraft, or
- direct contact with any part of the aircraft, including parts which have become detached from the aircraft, or
- direct exposure to jet blast.

For aviation safety statistics, injuries include serious and minor injuries.

Casualties are excluded when the injuries are from natural causes, self-inflicted or inflicted by other persons, or when the injuries are to stowaways hiding outside the areas normally available to the passengers and crew.

Energy and the environment

Tables T 9.1–T 9.2

Australian petroleum sales data include reporting companies' own use of petroleum products, but excludes refinery fuel.

33. Includes all LPG production and trade.
34. All diesel imports are included in automotive diesel.

Table T 9.3

Annual average retail petrol prices are calculated as a simple average of daily unleaded petrol prices at metropolitan and regional locations across Australia (where prices are available).

National averages are calculated as weighted averages of the state/territory prices, with weights based on vehicle numbers using petrol in each region.

Tables T 9.4–T 9.13

Emission estimates that are provided in terms of carbon dioxide equivalent emissions in Tables T 9.4 and T 9.5 include directly radiative gases only (carbon dioxide, methane and nitrous oxide). The estimates of carbon dioxide equivalent emissions do not include the indirect effects of gases such as carbon monoxide, nitrogen oxides and non-methane volatile organic compounds. Emission estimates are available in Tables T 9.6 to T 9.8 for carbon dioxide, methane and nitrous oxide without conversion to carbon dioxide equivalent.

Greenhouse gas emissions presented in Australian infrastructure statistics yearbook 2014 represent emissions from end-use activity only. That is, they do not include emissions from 'upstream' activity (primarily fuel refining). Greenhouse gas emission estimates provided in Australian Transport Statistics Yearbook 2009 were presented on a 'full fuel cycle' basis (inclusive of 'upstream' emissions).

Estimates for maritime and aviation emissions only include domestic transport (coastal shipping and domestic aviation).

A discussion of the modelling techniques used is available in Greenhouse Gas Emissions from Australian Transport (BTRE 2006b).

Part E Energy infrastructure

Table E I.1

Table E I.1 provides estimates of engineering construction work done on energy infrastructure, providing energy detail to the data provided in Table I 2.1. For the 2014 issue of Yearbook, estimates are no longer provided for construction work done of Gas and other hydrocarbons projects. The ABS definition of pipelines used in this table includes oil and gas pipelines, urban

supply mains for gas, pipelines for refined petroleum products, chemicals, etc. Pipelines used for water supply are included in the category 'water storage and supply' (see Table W 1.1).

Table E 1.2, E 1.3 and E 3.6

Early statistics (up to 1993–94) presented in these tables were sourced from a Historical Data Disk produced by ESAA. ESAA also provided data from 1997–98, however data for 1994–95 to 1996–97 were not available. From 1997–98, measures of ACT activity were included with NSW and were not available separately.

Table E 1.4

Table E 1.4 provides reliability measures of electricity supply. In general, data have not been normalised to exclude distribution outages beyond the reasonable control of the network operator. However, adjustments have been made to estimates for Queensland in 2005–06 to take into account the impact of Cyclone Larry, and estimates for New South Wales in 2006–07 to take into account extreme storm activity in that year.

Raw inputs to energy supply

Table E 2.1

Australia's economic demonstrated mineral energy resources are estimated by Geoscience Australia using a methodology based on the McKelvey resource classification system. It classifies identified mineral resources according to two parameters: the degree of geological assurance and the degree of economic feasibility of exploitation.

The degree of geological assurance is determined by the results of geological testing. A demonstrated resource is considered to exist where the tonnage, density, shape, physical characteristics, grade and mineral content of a deposit can be estimated with a reasonable level of confidence. Overlaying the measure of geological assurance is the economic feasibility of the extraction or production of the mineral. A demonstrated mineral energy resource is determined to be economic when 'profitable extraction or production under defined investment assumptions has been established, analytically demonstrated, or assumed with reasonable certainty' (GA 2013).

Table E 2.2 and E 2.3

These tables show the input fuels used to generate electricity (Table E 2.2) and gas (Table E 2.3) measured in terms of energy units (petajoules) and physical measures (units vary depending on input fuel type). BREE presents energy use statistics in terms of energy units only; BITRE has converted these measures to physical units using conversion factors provided in Energy in Australia (BREE 2013a).

Energy production and usage

The majority of statistics provided in this chapter are sourced from the BREE Australian energy statistics (AES) database, as published on the BREE website. The AES uses a methodology which balances energy consumption estimates with production and trade estimates. As such, data from AES are internally consistent, but may differ slightly from individual source datasets.

Energy consumption estimates are provided as a net concept. That is, intermediate consumption of energy (energy used to produce energy products) is not included in estimates of total energy consumed (further explanation is provided in *Australian Energy Statistics*, BREE 2014b).

Where separate estimates for ACT are not provided in state/territory tables, ACT estimates are included with NSW estimates. Estimates of energy consumption by industry are compiled based on a modified form of the 1993 version of the Australia and New Zealand Standard Industry Classification (ANZSIC). The ANZSIC was updated in 2006, however the industry classification used for energy consumption estimates has not been updated to avoid breaks in time series and consequential breaches of confidentialised data.

For several detailed energy consumption tables, there are time series that are not published to preserve the confidentiality of individual responses. Where this has occurred, suppressed estimates have been included in totals.

Table E 3.10

In converting black coal consumption estimates from energy units (petajoules) to physical units (kilotonnes), a number of assumptions had to be made relating to the grade of coal used in each state/territory and industry. The energy content of solid fuels in Australia for some states and some categories of fuel are provided in *Energy in Australia* (BREE 2013a). Where the energy content of a fuel type is not available for a particular state, assumptions were made based on energy content of fuels used by similar industries or in nearby states.

For NSW, BITRE assumes that the representative grade of coal used by the food, beverages and tobacco industry is washed thermal coal, the grade of coal used by other manufacturing industries (including the suppressed industries: cement, lime, plaster and concrete; iron and steel; and basic non-ferrous metals manufacturing industries) is steelworks grade coal, and the coastal shipping bunkers and other industries use unwashed thermal coal. The electricity generation industry in NSW uses a grade of black coal specific to that industry.

For VIC, BITRE assumes that the representative grade of coal used by all manufacturing industries has the same energy content as NSW washed thermal coal. In addition, BITRE assumes that non-manufacturing industries use the same grade of coal as NSW non-manufacturing industries (unwashed thermal coal).

The electricity generation industry in QLD uses a grade of black coal specific to that industry and that state. For all other industries in QLD, BITRE assumes that the representative grade of coal is other non-export grade.

For SA, BITRE assumes that the representative grade of coal used by all manufacturing industries has the same energy content as NSW washed thermal coal. In addition, BITRE assumes that non-manufacturing industries use the same grade of coal as NSW non-manufacturing industries (unwashed thermal coal).

For WA and TAS, Energy in Australia (BREE 2013a) only provides one conversion factor for each state (thermal coal).

Table E 3.13

State and territory based estimates of petroleum fuel consumption by the petroleum refining and basic chemicals manufacturing industries are not separately available for publication, but have been included in the other manufacturing industry. Estimates for the petroleum refining and basic chemical manufacturing industries are available at the national level.

- I. Estimates of Australian petroleum fuel consumption include all petroleum fuels, but exclude petroleum-based lubricants and greases.

Table E 3.14

Annual world crude oil prices are presented as the average of quarterly prices compiled by BREE from posted or official selling prices with Rotterdam spot prices for Middle East and North Sea crudes.

2. Middle East crude, 32 American Petroleum Institute (API) gravity.
3. North Sea crude, 38 API gravity.
4. North American crude, 40 API gravity.
5. Australian crude, 42 API gravity.
6. Malaysia tapis blend, 44 API gravity.

API gravity is an international standard measure of crude oil density, with higher API gravities signifying lighter oils. Light crude oil has an API gravity higher than 30.

Energy safety and emissions

Table E 4.1

There are few datasets available that provide quality estimates of health-related issues for the production or use of energy in Australia. Annual estimates of hospital admissions due to exposure to electricity, radiation, or extreme temperature/pressure have been provided in Table E 4.1. Further disaggregation of these estimates to measure admissions by states is not possible.

Table E 4.2 and Table E 4.3

Greenhouse gas emissions provided elsewhere in the Yearbook are presented as direct or 'Scope 1' (National Greenhouse Gas Inventory terminology) emissions. This excludes upstream or indirect emissions from the conversion of energy to its final form. The National Greenhouse Gas Inventory defines 'Scope 2' emissions as 'indirect greenhouse gas emissions from the generation of purchased electricity'.

The sum of all estimates of the direct (Scope 1) greenhouse gas emissions for the electricity generation industry that are presented in Tables E 4.2 and E 4.3 are equal to the sum of Scope 2 emissions for all industries.

Part C Communications infrastructure

Table C 1.1

Table C 1.1 provides estimates of engineering construction work done on telecommunications infrastructure, drawing together telecommunications data provided in Table I 2.1.

Table C 1.2

Table C 1.2 provides a number of broad indicators of capital investment by selected communications industries using the national accounts concepts gross fixed capital expenditure, net capital expenditure, and depreciation and amortisation.

Gross fixed capital expenditure represents the total value of producers' acquisitions less disposals of fixed assets during a financial year, where fixed assets are assets used repeatedly in processes of production for more than one year (e.g. vehicles, machinery, capitalised computer software, computers, electronics, houses, buildings and structures, mining exploration expenditure, etc).

Net capital expenditure represents the value of total capital expenditure less disposal of assets, while depreciation and amortisation represent the notional reduction in value (consumption) of an asset over the life of the asset, apportioned to the reference time period (depreciation usually refers to the reduction in value of tangible assets and amortisation usually refers to the reduction in value of intangible assets).

Investment in information technology

Table C 2.1 to Table C 2.3

These tables provide a statistical summary of investment in information technology assets by businesses classified to the information media and telecommunications industry, with assets classified by broad technology.

1. Gross fixed capital formation is a measure of total expenditure on new and second-hand fixed assets, less sales of fixed assets, which occur during the reference period.
2. Consumption of fixed capital represents the reduction in the value of fixed assets resulting from physical deterioration, obsolescence or accidental damage that occurs over the reference period.
3. Information technology net capital stock is a measure of the total value of all information technology capital assets held at the end of the reference period. The change in net capital stock from the end of one financial year to the next is equivalent to gross fixed capital formation (Table C 2.1) less consumption of fixed capital (Table C 2.2).

Subscribers and providers

Table C 3.1 to Table C 3.2

Statistics on communications subscribers and providers are classified according to the technology or medium used. For telecommunications, Table C 3.1 provides estimates of the number of public payphones, fixed voice telephones and terrestrial mobile phones (excludes satellite mobile phones), while Table C 3.2 provides recent estimates of total number of terrestrial mobile subscribers.

Table C 3.3 to Table C 3.4

Table C 3.3 provides a summary of internet subscribers by download speed and type of subscriber; while Table C 3.4 provides a summary of internet subscribers by type of access connection. In earlier years, statistics for both tables reflect information gathered from a complete census of all internet service providers, but for the December 2009 collection, information was gathered from a survey of only the internet service providers with more than 1000 active subscribers.

Price and activity

Table C 4.1

The numbers presented in Table C 4.1 are an annual average of the quarterly telecommunication services index that contributes to the consumer price index estimation process. Indexes are available for capital cities only.

Table C 4.3

Table C 4.3 provides estimates of businesses undertaking internet commerce activity as a percentage of all businesses, including businesses with no internet connection.

Communications security

There is no known source for statistics on physical injuries associated with communications infrastructure. The Yearbook provides statistics on the number of telephone numbers listed on the ACMA Do Not Call register (covering unsolicited telemarketing calls and marketing faxes) and the number of 000 and 112 calls forwarded to emergency service organisations.

Part W Water infrastructure

Table W 1.1

Table W 1.1 provides estimates of engineering construction work done on water infrastructure, providing water detail to the data provided in Table I 2.1. Pipelines used for water supply and

sewerage and drainage are included in this Table, however the ABS definition of pipelines used in Table E 1.1 includes oil and gas pipelines, urban supply mains for gas, pipelines for refined petroleum products, chemicals, etc.

Table W 1.2

Current value of water infrastructure assets are measured as the written down replacement costs of fixed water assets. This concept represents the 'current cost of replacing the service potential of fixed water and sewerage business assets based on current technology'

1. BITRE estimates for urban water supply are sourced from utility reports in the National Performance Report published by NWC et al. (2014b). BITRE aggregates reports only for those utilities with more than 10 000 connections. For the majority of states there are relatively few water utilities with less than 10 000 customers; however, Tasmania were the exception to this rule, with most Tasmanian utilities falling below this threshold. This recently changed, with utilities amalgamating into three large water providers. A trial set of estimates were compiled for Tasmania on the new basis in 2007–08. New data are being added to Yearbook as they become available.

Table W 1.3 to Table W 1.4

2. A definition of 'large dams' is provided by the Australian National Committee on Large Dams (ANCOLD): The dam wall must be more than 15 m in height, or more than 10 m in height, but with:
 - a crest of at least 500 m in length,
 - a capacity of at least 1 million cubic metres,
 - a maximum flood discharge dealt with by the dam of at least 2000 cubic metres per second, or
 - unusual design.
3. From 2010–11, data are sourced from Water Storage (BOM 2014b). Capacity measures on Water Storage measure accessible capacity (excludes "dead storage"—water at the bottom of the dam, below the take-off pipe that cannot be accessed)

Table W 1.5

Water and sewerage infrastructure capital expenditure includes all capital expenditure on new works, renewals or replacements, other expenditure that would otherwise be referred to as capital and recycling water assets.

Table W 1.6

Water treatment plants providing full treatment generally use multiple processes to achieve high quality water. In addition to filtration and disinfection, plants may also undertake processes for taste and odour reduction.

Table W 1.7

The length of urban water mains includes all transfer, distribution, and reticulation mains, but excludes connections between mains and property meter; mains delivering recycled water for non-urban use (e.g. agriculture re-use), disused pipe lengths, privately owned mains, mains associated with source works (e.g. borefield mains), interconnecting mains between schemes or sources, and on-site mains within water facilities.

Table W 1.9

This table provides estimates of the average number of water main breaks, bursts and leaks. Estimates exclude breaks in mains to meter connections and above-ground seepage that can be repaired without shutting down the main.

Table W 1.10

Estimates of the number of sewerage treatment plants include all primary, secondary and tertiary level treatment plants.

Table W 1.11

The length of sewerage mains and channels includes all trunk, pressure and reticulation mains, but excludes connections between mains and properties, and conduits carrying treated effluent downstream from treatment plants.

Table W 1.13

The definition of recycled water treatment plants used in Table W 1.13 includes sewerage treatment plants where the majority of treated water output has undergone additional treatment beyond tertiary standard for discharge to meet the requirements of the recycled water customer.

Table W 1.14

This table provides estimates of the average number of breaks or chokes to sewer mains, where a break is any failure of a sewer main leading to an interruption to service and a choke is a confirmed partial or total blockage.

Table W 1.15

A regulated river normally has a dam or weir structure that regulates or diverts the flow of water to storages or supply networks.

Table W 1.16

Table W 1.16 provides a measure of the current cost of replacing assets (excluding administration, buildings, furniture fittings, equipment, vehicles and corporate service networks). This measure does not take into account accumulated depreciation based on the age and remaining life of the assets.

Water inputs

Table W 2.1

The total volume of rainwater available each year is a function of the area averaged annual state and territory rainfall and the land area of each state/territory.

4. Includes mainland area and island area. Total Australian island area is 32,163 square kilometres.
5. NSW figures include estimates for New South Wales, the Australian Capital Territory and Jervis Bay territory.

Table W 2.2

Surface water sources include dams, rivers or irrigation channels.

Table W 2.3

The volume of water sourced from groundwater excludes water sourced from groundwater supplies that have been artificially recharged using sources of water already counted elsewhere, such as:

- rivers;
- desalination plants; and
- sewage treatment plants.

Other forms of artificial groundwater recharge (e.g. storm water) that have not already been counted are included.

Table W 2.5

The volume of water sourced from recycling includes all recycled water from direct or indirect reuse. This measure includes only recycled water used as a substitute for potable water.

Table W 2.6

The volume of residential sewage, non-residential sewage and non-trade waste includes volumes collected in the sewerage system due to stormwater, illegal connection inflow and infiltration to the sewerage system. Estimates of the volume of trade waste include liquid waste generated from any industry, business, trade or manufacturing process and stormwater collected in the trade waste system.

Table W 2.7

The consumer price index for water and sewerage services provides a measure of annual changes in the price to consumers of water and sewerage services.

Table W 2.9

The measure of treated waste water intake by the rural water supply network (Table W 2.9c) complements the measure of urban water sourced from recycling (Table W 2.5) as it represents the volume of recycled water that is not used as a substitute for potable water.

Table W 2.10

6. Entitlement trading includes, but is not limited to, water access entitlements. Water access entitlements are 'a perpetual or ongoing entitlement to exclusive access to a share of water from a specified consumptive pool as defined in the relevant water plan'.
7. Water allocations are 'the specific volume of water allocated to water access entitlements in a given season, defined according to rules established in the relevant water plan' (NWC 2014a)

Water supply and use

Table W 3.2 and Table W 3.5

Table W 3.2 provides estimates of the number of properties connected to the urban supply network, while Table W 3.5 provides estimates of the number of properties connected to urban sewerage services. To be included, properties must be connected to the networks as a separate entity. Properties that are connected but are non-rateable or non-metered are included, while properties that are rateable, but not connected are excluded. Strata title flats or units are counted as separate properties, but a site with no more than 10 per cent of its properties as non-strata title units may be counted as one property.

8. The volume of water supplied for other uses includes estimates of water used for firefighting, mains flushing, losses due to faulty meters, leakage and any other consumption.

Table W 3.6

9. Recycled water would generally be provided via a third (non-potable, non-sewerage) pipe system.
10. Includes recycled water supplied to golf courses, heavy industry and commercial areas.
11. Recycled water used to irrigate forestry, pastures for livestock and other agricultural products.
12. Recycled water used on-site at water treatment plants that is external to the treatment process.

Table W 3.8 and Table W 3.9

Table W 3.8 provides an estimate of the volume of water supplied to customer service points by rural water service providers, while Table W 3.9 provides an estimate of the volume of water consumed by agricultural activity. Conceptually, the majority of the difference between the estimates in the two tables represents rural water extracted from sources other than the major rural water service providers.

Table W 3.10

13. The register of all farms in scope of the statistical collection prior to 2005–06 was maintained internally by ABS. From 2005–06 on, the register of all farms was derived from the Australian Business Register, maintained by the Australian Taxation Office.
14. This series groups several agricultural activities into the one measure. Relative standard errors were calculated for component series, but are not available for the new measure.

Table W 3.12

The application rate for irrigation water is calculated by dividing the total volume of irrigation water applied by the area of pasture or crop that is being irrigated.

Table W 3.14

The gross value of irrigated agricultural production (GVIAP) is the value placed on recorded production of agricultural commodities produced with the assistance of irrigation at wholesale market prices (prices realised in the market place). GVIAP is not a measure of the value that irrigation adds to production.

Health and emissions

Urban supply water quality standards are either specified in the utility's licence or franchise agreement, set by the state health regulatory agency or government, or in the absence of a formal agreement, the compliance of utilities is measured against the Australian Drinking Water Guidelines (2004).

Water supply zones are generally a discrete area of similar water quality. Zones may be based on the area served by one treatment plant or an area that is easily described by its boundaries or system characteristics.

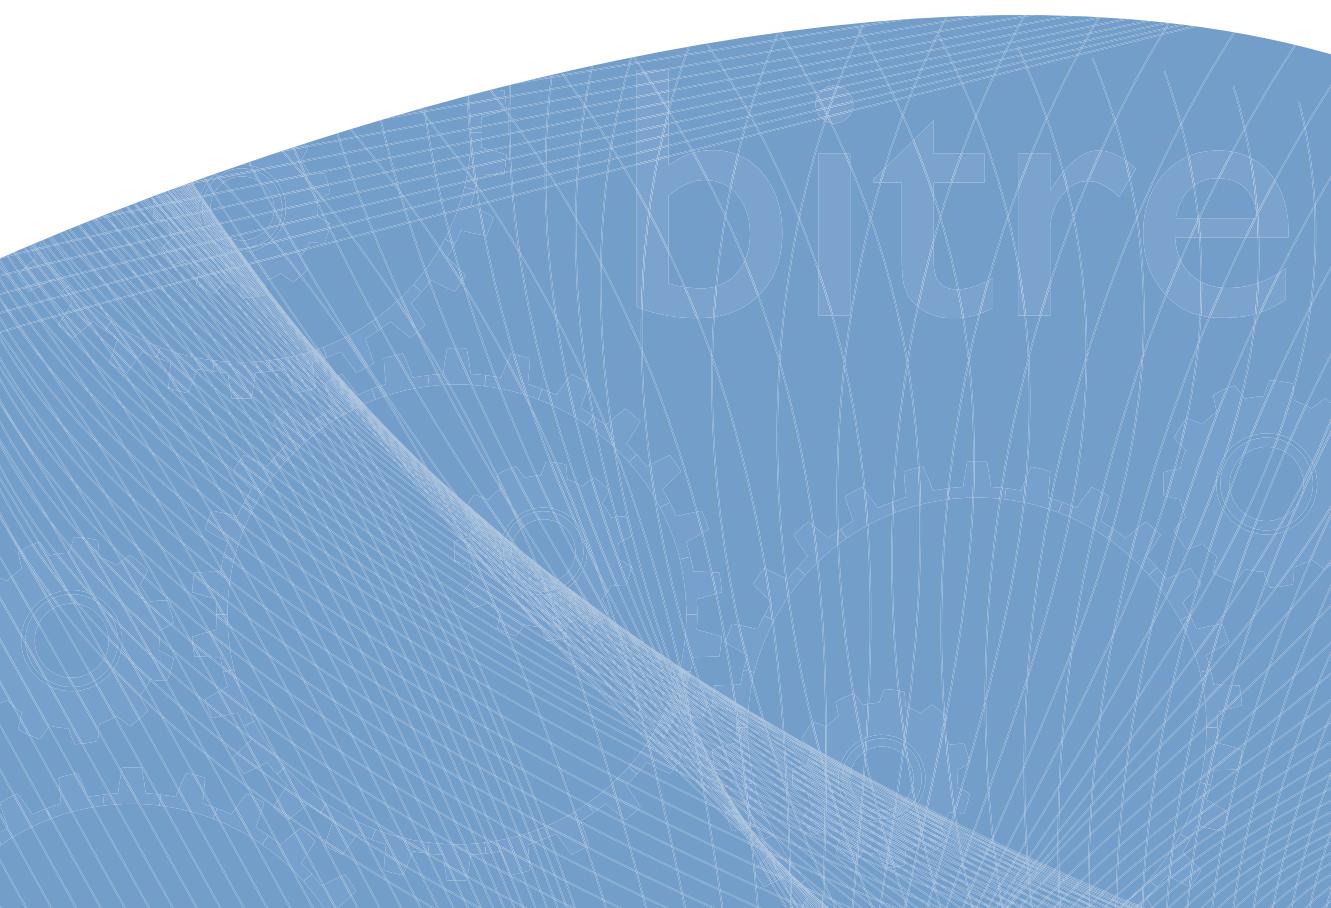

Table W 4.5, Table W 4.6 and Table W 4.7

Greenhouse gas emissions of transport, energy, communication or water activities can either be measured in terms of the direct emissions of the activity or all greenhouse gas emissions resulting from the activity (direct emissions plus upstream emissions, in particular the emissions resulting from the generation of purchased electricity). To avoid double counting, the preferred Yearbook greenhouse gas measures are for direct emissions only, with Table E 4.2 electricity generation emissions, representing all upstream emissions for the economy. In National Greenhouse Gas Inventory terminology, direct emissions represent 'scope 1' emissions, while emissions from the generation of purchased electricity represent 'scope 2' emissions.

As direct emissions statistics are not available for water supply networks, Table W 4.5 and Table W 4.6 provide estimates of greenhouse gas emissions from water supply and sewerage networks that include both end-use emissions and upstream emissions from the generation of purchased electricity. These estimates are not comparable with greenhouse gas emission estimates for other major forms of infrastructure presented in Parts T, E and C of the Yearbook, which present direct emissions only.

Table W 4.7 provides estimates of scope 1 greenhouse gas emissions from wastewater handling sourced from the National Greenhouse Gas Inventory.
