Road trauma Australia
2016 statistical summary

Department of Infrastructure and Regional Development
Canberra, Australia

At a glance

This report is the latest in a series of annual road crash statistical reports. It presents annual counts of fatalities, fatal crashes and injuries and standardised rates. The focus is on the last ten years.

Total deaths in 2016 were 1,295, an increase of 7.5 per cent compared to 2015. In 2016, total annual deaths were 19.2 per cent lower than that of ten years earlier. The estimated trend over the decade was an annual reduction of 2.9 per cent. All jurisdictions achieved trend reductions of 2 per cent per year or more. During the most recent three years however, the earlier trends have reversed, with increases in all jurisdictions (Table 1.1, p. 2).

In 2016 the number of annual deaths per 100,000 population was 5.37. This is 6.0 per cent higher than 2015 (5.06). Over the last decade this rate declined by a total of 30.3 per cent, equating to an estimated trend reduction of 4.4 per cent per year. In comparison to 2015, the 2016 rate was 6.0 per cent higher (Table 3.1, p. 36).

Analysis by age group shows that the population based rates of younger road users (aged less than 40) had greatest improvement. The rate for persons age 40-64 years is equivalent to the overall average, and the rates for those aged 17-25 years and for those aged 65 or over are above the national average (Table 3.2, p. 38).

Population rates for annual hospitalised injuries are available for the decade to 2011. During this time, annual hospitalised injuries per 100,000 population increased by 6 per cent to 152.6. In 2011, this rate was 27 times the population-based rate for fatalities, a multiple with value 16 in 2002 (Table 3.6, p. 41).

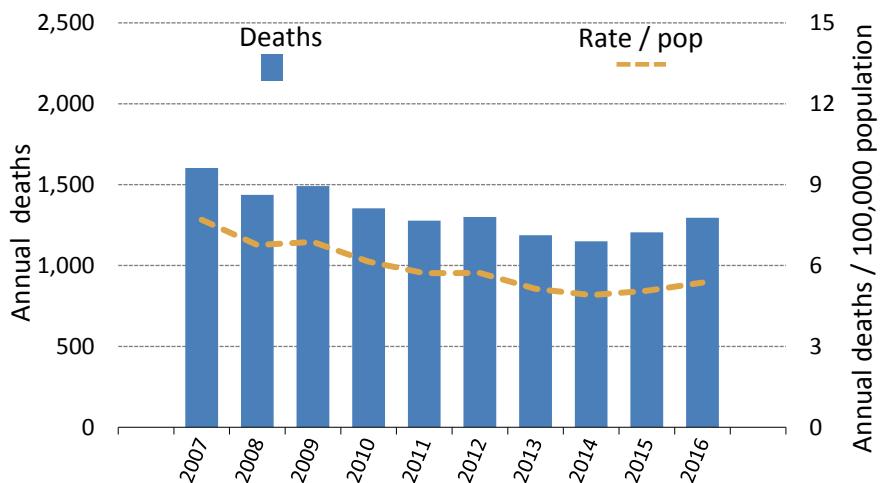

Approximately 45 per cent of all fatal crashes occur in posted speed zones of 100 km/hour or over. Twelve per cent occur in speed zones of 50 km/hour or under. The distribution of fatal crashes into the six speed zone groups presented has not changed appreciably over the decade (Table 2.6, p. 30).

In 2015, major cities accounted for 34 per cent of all fatal crashes (down from 40 per cent in 2008) (Table 2.8, p. 33 and Figure 2.6, p. 32).

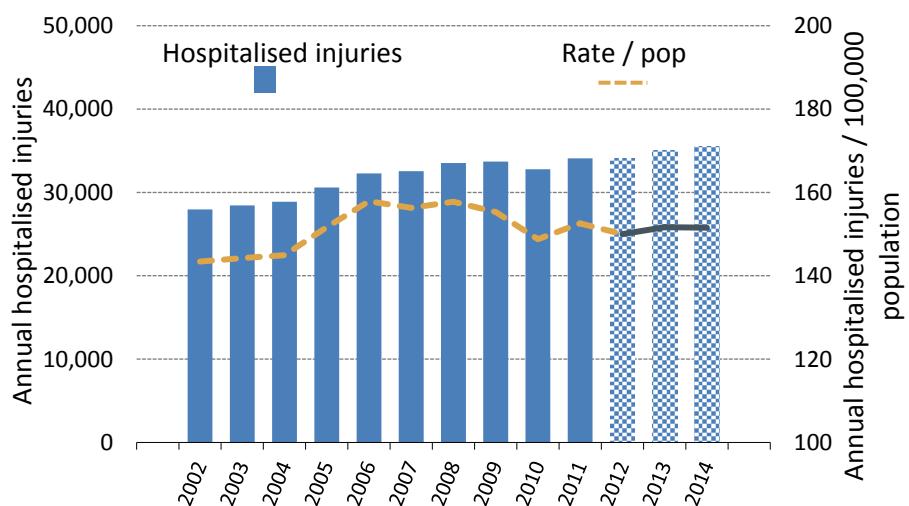

Urban areas – major urban and near-urban concentrations of over 10,000 people – accounted for 49 per cent of all fatal crashes and 86 per cent of the population (Table 2.9, p. 32).

During the last ten years, the count of total vehicle registrations increased by 24 per cent. Passenger car registrations increased by 20 per cent, motorcycle registrations increased by 62 per cent and light commercial vehicle registrations increased by 36 per cent (Table 6.3, p. 58).

Data Sources

The tables on fatal road crashes presented in this report are based on two databases: the Australian Road Deaths Database (ARDD) and the National Crash Database (NCD).

The Australian Road Deaths Database contains national road crash fatality data comprising basic demographic and crash information. Fatal crashes since 1989 are included and it is updated each month. The current data in spreadsheet format is available at <<https://www.bitre.gov.au>>. For this report, the April 2017 data was used.

The scope of the National Crash Database is national fatal and injury crashes and at present it covers the years 2008 to 2015. It is updated annually.

Due to the timing differences in data receipt and ongoing validation by data providers, there are minor data differences between the two databases.

Non-fatal road traffic crash casualty data (referred to here as ‘hospitalised injury’) is collated from published reports by the Australian Institute of Health and Welfare (AIHW) and by the National Injury Surveillance Unit (NISU), as well as from unpublished National Hospital Morbidity Database reports compiled by NISU. Refer to AIHW 2008 for information regarding inclusion criteria for traffic crash hospitalised injuries.

Section I People

This chapter presents annual counts of deaths and hospitalised injuries. Classifications include jurisdiction, road user group, age group, gender, common crash type and vehicle type. The data for fatalities covers the decade to 2016, with some tables showing more detail for the years 2008-2015. Hospitalised injuries (national only) are available for the years 2008-2014.

Deaths

- Total deaths in 2016 were 1,295, an increase of 7.5 per cent compared to 2015. In 2016, total annual deaths were 19.2 per cent lower than that of ten years earlier. The estimated trend over the decade was an annual reduction of 2.9 per cent. All jurisdictions achieved trend reductions of 2 per cent per year or more. During the most recent three years however, the earlier trends have reversed, with increases in all jurisdictions. (Table I.1, p. 2).
- Analysis of road user type shows that passenger deaths decreased at the fastest rate, with consistent reductions seen also for driver deaths and pedestrian deaths. No decreasing trends were seen in motorcyclist deaths or pedal cyclist deaths (Table I.1, p. 2).
- Of the age groups presented, deaths in the 17-25 years group have shown the fastest rate of decrease. This age group presently accounts for 20.5 per cent of all deaths. Road users aged 65 and over have increased, now accounting for 20.5 per cent of all deaths, whereas ten years ago this proportion was 15.3 per cent. (Table I.2, p. 6).
- Between 2008 and 2015, annual deaths from crashes involving a younger driver or rider (aged 17-25) decreased by 37.9 per cent. Over the same period, deaths from crashes involving an older driver or rider (aged 65 and over) increased by 22.6 per cent (Table I.7, p. 14).
- Approximately half of all deaths are from either head-on or single vehicle run-off-road crashes. This proportion has not changed over the five years to 2015 (Table I.8, p. 15).

Hospitalised injuries

- Between 2008 and 2011, when a change occurred in the data collection, hospitalised injury counts increased by 1.7 per cent (Table I.9, p. 16). Fatalities during this period decreased by 11.1 per cent.
- Analysis of hospitalised injuries by age group shows a similar pattern to fatalities: during 2008 to 2011, injuries to people aged under 40 years decreased by 0.6 per cent, whereas for people aged 40 years and over, they increased by 15.8 per cent (Table I.9, p. 16).

a Includes billion passengers.

b Drivers, passengers, pedestrians, motorcyclists, pedal cyclists and those with unstated or unknown road user type.

c 2012 calendar year data is not directly comparable with previous years due to a break in the hospitalised injury series in 2012. Victoria changed case inclusion criteria to exclude cases cared for solely in Emergency Departments from 1 July 2012. NISU estimates this decreased admitted case counts in Australia by 2000 cases (-5.6 per cent) in 2012-13 compared to 2011-12. The estimated decrease in 2012 was approximately 1000 cases, or -2.8 per cent, with the reduction likely to differ by road user group.

Sources National Injury Surveillance Unit, unpublished, hospitalised injury series.

Section 2 Crashes

This chapter presents annual counts of fatal crashes. Classifications include jurisdiction, crash type, road type, remoteness region, speed limit and time-of-day.

- In 2016, there were 1,201 fatal crashes, an increase of 9.1 per cent compare to 2015. Over the decade, counts for the types of fatal crash (single vehicle, multiple vehicle or pedestrian) declined by 22.3 per cent, 11.5 per cent and 17.2 per cent respectively. Over the last three years however, annual counts for each of these types have increased. Comparing 2016 to 2015, counts increased by 9.1 per cent (Table 2.1, p. 24).
- Fatal multiple-vehicle crashes are 2.6 times more likely to occur during the day (6am to 6pm) than during the night. Single-vehicle and pedestrian crashes are both distributed similarly between day and night (Table 2.2, p. 26).
- More fatal crashes occur during a weekday compared to a weekend (Table 2.3, p. 27). However when the proportions are weighted to account for the different lengths of the two periods, single-vehicle crashes are over-represented at the weekend, and multiple vehicle crashes are marginally over-represented on weekdays.
- Approximately 45 per cent of all fatal crashes occur in posted speed zones of 100 km/hour or over. Twelve per cent occur in speed zones of 50 km/hour or under. The distribution of fatal crashes into the six speed zone groups presented has not changed appreciably over the decade (Table 2.6, p. 30).
- In 2015, major cities accounted for 34 per cent of all fatal crashes (down from 40 per cent in 2008) (Table 2.8, p. 33 and Figure 2.6, p. 32).
- Urban areas – major urban and near-urban concentrations of over 10,000 people – accounted for 49 per cent of all fatal crashes and 86 per cent of the population (Table 2.9, p. 32).

Morning 3am to 8:59am **Midday** 9am to 2:59pm **Evening** 3pm to 8:59pm **Night** 9pm to 2:59am

^a A crash in which a pedestrian dies is classified as a pedestrian crash. All other crashes are classified by whether there are one or more moving vehicles involved.

^b Excludes crashes with unrecorded time.

Table 2.9 Fatal crashes by Significant Urban Area (SUA)^a

	<i>Urban area</i>	<i>Non-urban area</i>
2008	689	626
2009	668	678
2010	591	640
2011	536	615
2012	589	601
2013	514	585
2014	500	550
2015	541	561

a 'Urban' refers to Significant Urban Area. Significant Urban Areas (SUA) represent aggregations of whole Statistical Area Level 2 (SA2) boundaries and are used to define and contain major urban and near-urban concentrations of over 10,000 people. They include the urban population, any immediately associated populations, and may also incorporate one or more closely associated Urban Centres and Localities and the areas between. They are designed to incorporate any likely growth over the next 20 years. Significant Urban Areas do not cover the whole of Australia, and may cross state or territory boundaries.

Table 2.10 Fatal crashes by Urban Centre and Locality (UCL)^a

	<i>All</i>	<i>Remainder</i>
2008	690	734
2009	604	875
2010	542	802
2011	511	755
2012	568	720
2013	486	692
2014	466	677
2015	479	727

a 'UCL' refers to Urban Centre and Locality. An 'Urban Centre' is generally defined as a population centre with a 'core urban population' of 1,000 or more people. A 'Locality' is generally defined as a population centre of between 200 and 999 people. People living in Urban Centres are classified as urban for statistical purposes while those in 'Localities' are classified as rural, that is, non-urban.

Figure 2.7 Average number of persons killed per fatal crash by speed zone

Source Australian Road Deaths Database

SECTION 3 Rates

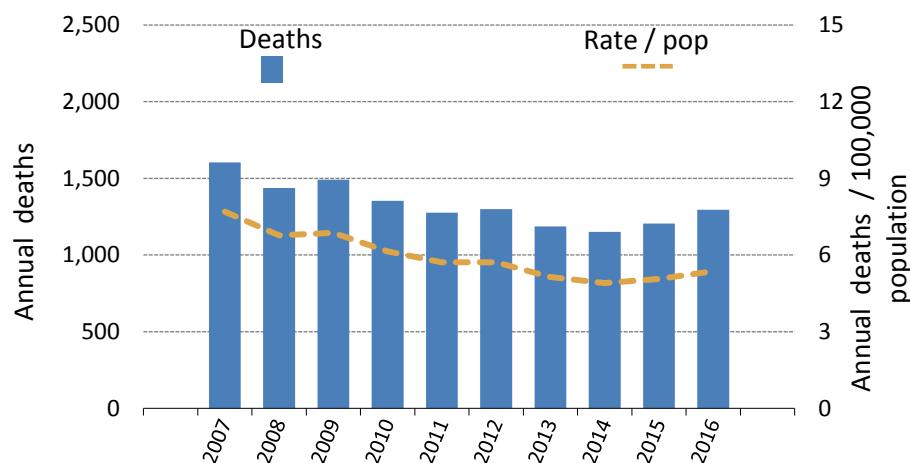

This section presents rates for fatalities and hospitalised injuries standardised by population, vehicle kilometres travelled (VKT) and vehicle registrations. Included are comparisons for jurisdictions, age groups and gender. In general, rates are composed of fatalities during the calendar year divided by the exposure measure at the mid-point.

- In 2016 the number of annual deaths per 100,000 population was 5.37. This is 6.0 per cent higher than 2015 (5.06). Over the last decade this rate declined by a total of 30.3 per cent, equating to an estimated trend reduction of 4.4 per cent per year. In comparison to 2015, the 2016 rate was 6.0 per cent higher (Table 3.1, p. 36).
- The largest reductions in the population rate were achieved in Queensland, South Australia and the Australian Capital Territory. Smaller but significant reductions were achieved in all other jurisdictions (Table 3.1, p. 36 and Figure 3.2, p. 37).
- Analysis by age group shows that the population based rates of younger road users (aged less than 40) had greatest improvement. The rate for persons age 40-64 years is equivalent to the overall average, and the rates for those aged 17-25 years and for those aged 65 or over are above the national average (Table 3.2, p. 38).
- The annual rate per VKT over the decade has declined by 28.6 per cent, similar to the decline in the population rate (Table 3.3, p. 39).
- Per registered vehicle, the rates have declined by approximately 36 per cent over the decade (Tables 3.4 and 3.5, p. 40).
- Population rates for annual hospitalised injuries are available for the decade to 2011. During this time, annual hospitalised injuries per 100,000 population increased by 6 per cent to 152.6. In 2011, this rate was 27 times the population-based rate for fatalities, a multiple with value 16 in 2002 (Table 3.6, p. 41).

SECTION 4 National Road Safety Strategy 2011–2020 statistical progress

The National Road Safety Strategy 2011–2020 lists a number of statistics that will be used to monitor progress against the targets within each of the Strategy's four cornerstones (Safe Roads, Safe Speeds, Safe Vehicles and Safe People). These statistics were first published by the Transport and Infrastructure Council in November 2013. The present chapter updates these statistics to 2015.

Total deaths in 2016 were 1,205. This was 9.2 per cent higher than NRSS based period (2008–2010).

For further detail and current data see www.roadsafety.gov.au.

Figure 4.1 NRSS 2011–2020 statistical progress towards fatality target

**Table 4.1 National Road Safety Strategy (NRSS) statistical progress
– High level outcome measures**

Measure	Baseline (2008-2010) ^a	2015 ^b	% Change baseline – 2015
Number of deaths resulting from road crashes	1,426	1,206	-15.4
Number of road crashes resulting in deaths	1,297	1,102	-15.0
Number of deaths per 100,000 population	6.5	5.0	-22.5
Number of deaths per 100 million vehicle kilometres travelled	0.65	0.49	-24.8
Number of deaths per 10,000 registered vehicles	0.91	0.67	-26.4

a Average annual number during the three-year period 2008 to 2010.

b Uses data from the National Crash Database.

SECTION 5 Historical series

This section presents longer time series of annual fatalities, crashes and rates.

- Over the last 30 years, annual fatalities decreased by 53.3 per cent. By jurisdiction, the reductions range from 9.4 per cent for Western Australia to 60.1 per cent for New South Wales and 75.0 per cent for the Australian Capital Territory (Table 5.1, p. 48).
- Comparing the trends by road user group, the strongest reductions are for passengers (72 per cent over 30 years), pedestrians (63 per cent) and pedal cyclists (63 per cent) (Table 5.2, p. 49).
- As for the most recent decade, the longer term reductions are strongest for younger age groups. Deaths of road users aged under 40 declined by 53.9 per cent over 25 years, and for 40 years and over, the decline was 12.4 per cent (Table 5.3, p. 50).

SECTION 6 Exposure series

This section presents longer time series of exposure data.

- During the ten years to 2016, Australia's population increased by 15.9 per cent. By jurisdiction, the increments ranged from 5.2 per cent (for Tasmania) to 24.3 per cent (for Western Australia). Over the last 30 years, Australia's population increased by 48.4 per cent. Queensland's and Western Australia's populations increased the most (81 per cent and 75 per cent respectively) (Table 6.1, p. 56).
- By age group, the population of people aged 40 years and over, increased during the ten years to 2016 by 19.2 per cent. For people aged under 40 years, the increment was 13.0 per cent. Over 30 years the population of people aged 40 years and over increased by 89.7 per cent, and for the younger age group, the increment was 24.6 per cent (Table 6.2, p. 57).
- During the last ten years, the count of total vehicle registrations increased by 24 per cent. Passenger car registrations increased by 20 per cent, motorcycle registrations increased by 62 per cent and light commercial vehicle registrations increased by 36 per cent. In the last 30 years, registered vehicles increased by 96.2 per cent: registrations of Light Commercial vehicles increased by 149 per cent and Motorcycles increased by 136 per cent (Table 6.3, p. 58).

Note During 1995 and 1996, the State/Territory jurisdictions introduced the National Heavy Vehicle Registrations Scheme. Using data from this scheme resulted in improved accuracy for counts of registrations of articulated and rigid trucks but its introduction caused some fluctuations in the data for the period 1991 through 1996.

Glossary

The following definitions are general explanations only. The precise definitions vary across the organisations that provide the source data. These differences may result in minor inconsistencies between jurisdictions for some variables.

Road deaths from recent months are preliminary and subject to revision.

<i>Articulated truck</i>	A motor vehicle primarily for load carrying, consisting of a prime mover that has no significant load carrying area but with a turntable device which can be linked to one or more trailers.
<i>BAC</i>	Blood alcohol concentration (BAC) refers to the amount of alcohol present in the bloodstream.
<i>Bus</i>	A motor vehicle constructed for the carriage of passengers which has at least 10 seats, including the driver's seat.
<i>Counterpart</i>	The other vehicle or object that collides with the mode of transport of an injured person.
<i>Crash</i>	Any apparently unpremeditated event reported to police, or other relevant authority, and resulting in death, injury or property damage attributable to the movement of a road vehicle on a public road.
<i>Fatal crash</i>	A crash for which there is at least one death.
<i>Fatal crash involving heavy vehicles</i>	Fatal road traffic crashes in which one or more heavy vehicles were involved (articulated truck, heavy rigid truck or bus).
<i>Gross Vehicle Mass (GVM)</i>	Tare weight (i.e. unladen weight) of the motor vehicle plus its maximum carrying capacity excluding trailers.
<i>Heavy rigid truck</i>	A motor vehicle of GVM greater than 4.5 tonnes constructed with a load carrying area. Includes a rigid truck with a tow bar, draw bar or other non-articulated coupling on the rear of the vehicle.
<i>High threat to life injury</i>	'High threat to life' hospitalised injury cases are a subset of all hospitalised injury cases, referred to also as 'life-threatening' injuries. They are selected on the basis of having an ICD Injury severity Score (ICISS) of less than 0.941. See Australian Institute of Health and Welfare 2016 for definition and discussion.
<i>Hospitalised injury</i>	A person admitted to hospital from a crash occurring 'in traffic'. Traffic excludes off-road and unknown location.
<i>Older driver/motorcycle rider</i>	A person driving a motor vehicle or riding a motorcycle (excluding passengers) aged 65 years and over.

<i>Road death or fatality</i>	A person who dies within 30 days of a crash as a result of injuries received in that crash.
<i>Trend estimation</i>	In this report, the figures for the 'average trend change p.a.(%)' are calculated by fitting an exponential trend line to the last ten data points. The Excel function LOGEST performs the fit. The resulting trend line represents a constant annual percent change over the period. Notes: (i) The occurrence of a zero in the original series precludes trend estimation by this method; (ii) When fitted to a series containing small numbers, the result may not be a reliable indicator of a stable trend.
<i>Young driver/motorcycle rider</i>	A person driving a motor vehicle or riding a motorcycle (excluding passengers) aged between 17 and 25 years inclusive.
