# BTE Publication Summary

# **Consumer Preferences in Urban Buses and Bus Services, Part C - Household Survey**

## Report

This Report presents the household part of the results of a consumer preference survey into bus design and bus service characteristics. The survey was conducted by the BTE together with the Metropolitan (Perth) Transport Trust, and consisted of two parts: household interviews carried out by the Australian Bureau of Statistics; and questionnaires distributed to travellers using the Perth suburban bus service.

INTRODUCTION

The results of the household phase of the study are presented in this section of the report.

The household survey was conducted over two weeks in mid September 1975. The survey conducted by the ABS on behalf of the MTT and BTE was preceeded by a pilot study in August. The pilot survey was used to discover ambiguities and difficiencies in proposed questionnaires and to evaluate survey techniques.

Unlike the onboard survey the household phase survey is purely attitudinal. Respondents were asked along with personal and trip making information to express their attitudes on aspects of buses and bus services in the form of ranking, rating and preference questions.

Surveys of this type may be criticised on the grounds that there is no guarantee of a nexus between stated attitude and behaviour. Another problem is that respondents tend to associate the option or characteristic being evaluated with the option or characteristic as incorporated in the bus system they are familiar with. A further problem is that preferences are also influenced by the social and climatic conditions prevailing in the survey region.

Details of the survey are presented in Chapter 1 and the results in Chapter 2. The results in Chapter 2 are summarised from the detailed analyses presented in Annex CC and CE. Other information pertinent to the analysis presented in the Annex are details of:

- . Survey forms
- Sample characteristics
- . Respondent travel characteristics
- . Survey data computer file format
- . BTE suburb directory

- 1 -

#### CHAPTER C 1

#### DETAILS OF THE SURVEY

#### PERTH CHARACTERISTICS

Details of the Metropolitan (Perth) Passenger Transport Trust (MTT) operations as they affected the onboard survey are set out in Chapter B1. While the household survey is purely attitudinal, the response to the factors considered in a survey of this type are conditioned by the existing bus service characteristics. Consequently information contained in Chapter B1 and Annex BE is relevant and should be considered when reviewing the survey results. Similarly, responses to aspects of bus design related to temperature control will be conditioned by the Perth climate. Thus, any attempts to translate results of the survey must take due account of the above externalities.

In summary the following are pertinent:

- Perth is located at latitude 32° 00's and a longitude of 115° 50'E. At the 1971 Census, the area of the Perth Statistical Division was approximately 564,000 hectares and its population was 703,199;
- The climate is temperate seaboard, with an annual mean temperature of 18.1C and annual mean minimum and maximum temperatures of 13.1C and 23.1C respectively. The annual mean rainfall is 883 mm.
- The city and its environs are serviced by an extensive system of roads, bus services and railways along several well defined corridors. There are 1345km of bus routes on which 58,765,307 passengers were carried during the 1973-1974 fiscal year.

#### SURVEY SAMPLE

As the household survey phase was conducted in association with the onboard survey, the sample was limited to the Perth Statistical Division. The division contains 1034 Census Collector Districts (CCD's), of which 81 were selected. The Australian Bureau of Statistics selected the sample CCD's and starting points within the CCD on a random basis and set the sample interval to provide a minimum of 1,000 returns. In setting the sample size to achieve the specified number of returns, due account was taken to allow for refusals, absentees and persons and dwellings out-ofscope. Persons in scope included all those present in the household on the night before the first approach who were fifteen years or older. Households in scope included all private dwellings including private co-operative boarding houses, excluded commercial boarding houses.

A map showing the distribution of sampled CCD's is presented in Figure C1.1.

#### PILOT SURVEY

A pilot survey was conducted during the week 19 to 26 July 1974, with ten ABS interviewers. Four separate form types were evaluated; three involved interview techniques and one was a self-administered questionnaire.

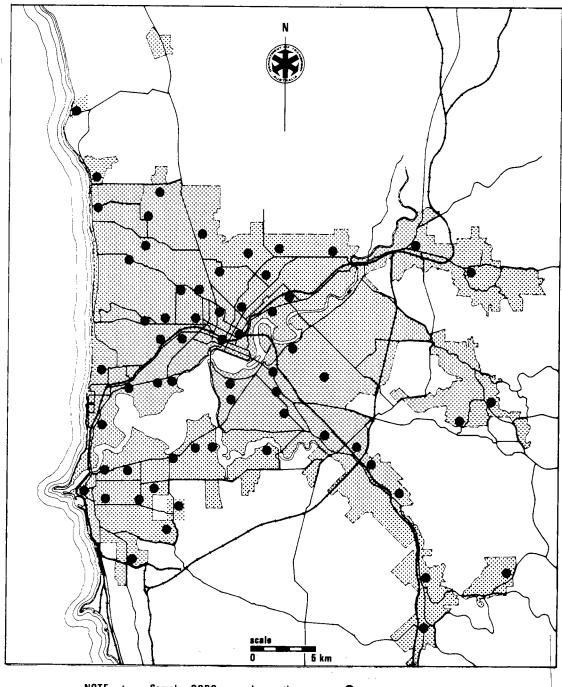

The results of the survey indicated that contrary to the experience gained from the Brisbane Survey, the interview methods gave superior responses to those of the selfadministered method. In addition, the interview from employing shuffle board techniques for ranking questions and prompt cards for rating questions was better received by the respondents; was easier to manage, and consequently, was adopted. Other significant refinements suggested by the results were:

- The adoption of a descriptive seven point ranking scale to be numerically coded by the interviewer and not the respondent; and,
- . Reworded questions which eliminated ambiguities and possible confusion.

#### MAIN SURVEY

The survey proper was conducted during the period 9 to 26 September, 1974, by a team of 14 ABS interviewers

- 4 -

NOTE : Sample CCDS are shown thus Sampled CCDS not shown are : Medina , Parmelia , Rockingham , Jarrahdale Urban Areas are shown shaded

FIGURE C1.1 DISTRIBUTION OF SAMPLED CCDS WITHIN PERTH STATISTICAL DIVISION

- 5 -

(some of whom had been involved on the pilot survey). The interviewers were supplied with dwelling control forms (see Annex CA) which contained the addresses of the households to be sampled. Block plans with the locations of households were also supplied.

The demographic details of the household inhabitants was recorded by the interviewer on the dwelling control form. This information was then transferred to the personal schedule before each of the eligible respondents was interviewed. The interviewer then questioned the interviewees on an individual basis preferably in the absence of the other potential respondents. A summary of responses to the survey is presented in Table C1.1

TABLE C1.1 - RESPONSE TO THE SURVEY

Households in sample	548
Vacant out-of-scope households	92
Household refusals	39
	679
Schedules not obtained from eligible respondents	96
Schedules completed but unusable	0
Schedules satisfactorily completed	935
	1031

The overall response rate was 91  $percent^{(1)}$  which is equivalent to 1.70 returns per dwelling total of 1.88 returns per sampled dwelling. The above ratios represent 74 and 81 percent respectively of the approximate average number of eligible persons per dwelling in the Perth Statistical Division (an average of 3.33 persons per dwelling and 69 per-

(1) Percentage of completed schedules to total number of known eligible persons.

cent of persons in scope; i.e. over the age of 15 years, giving 2.30 eligible persons per dwelling).

These response rates are slightly higher than those obtained for the Brisbane study (probably attributable to the interview techniques adopted), and are favourable in consideration of the length of the interview. A majority of the respondents were enthusiastic and showed interest in the aims of the survey.

#### SURVEY QUESTIONNAIRE

The questionnaire is described in Annex CA. The questionnaire consists of sections covering the following areas of information:

<u>Section 1</u>: contains questions<sup>(1)</sup> relating to the respondents! relation to household head, sex, age and marital status (Questions 1-4)

<u>Section 2</u>: relates to the respondents<sup>4</sup> trip habits including the modes of transport used for various trip tasks, the number of bus trips made each week, and the respondents driving licence status which has a bearing on the above (Questions 5-7).

<u>Section 3</u>: contains two sets of bus design and bus service and travel characteristics. Respondents were asked to assign a ranking relative to the other characteristics in each set. Shuffle boards were used to assist the respondents in ranking (Questions 8-9).

<u>Section 4</u>: contains thirteen sets of design options which might be available as methods of achieving specific design objectives. For each option, respondents were requested to rank the option between highly undesirable through uncertain or indifferent to highly desirable. The respondents were unaware of the numeric ranking scale; the interviewer was responsible for entering the

 The reply to these questions was transferred from the dwelling forms. corresponding ranking number on the questionnaire. The ranking scale used was: highly desirable (1), uncertain or indifferent (4), with highly desirable (7). Flash cards were used to provide a visual list of the design option in each set or illustrations where pictures are used to show the option (Questions 10-22).

<u>Section 5</u>: contained questions relating to bus exteriors, interiors and seat colour schemes. Respondents were asked to indicate their preference of colour and its shade. Provision was made for a colour preference not listed and for indicating no preference at all. Similarly, provision was made for indicating no preference in shade (Questions 23-25).

<u>Section 6</u>: finally requested information relating to the respondents' main activity during the previous week and the respondents' gross weekly or annual salary (Questions 26-27).

#### CHAPTER C2

#### RESULTS

#### PRELIMINARY PROCESSING

Completed schedules were received as a group from each household together with their Dwelling Control Form. Each dwelling was given a number which was stamped onto the Control Form and the Schedules associated with the dwelling. As the schedules were to be key punched onto two data cards, cross reference information (dwelling number, person number and card number), was added at the beginning of the schedule and at the record immediately following the last entry on the first card.

The information on the Dwelling Control Forms was transferred to the BTE Dwelling Control Data Form together with information on response rates.

The information obtained on the Personal Schedules and the Dwelling Control Data Forms was key punched directly onto data cards and spooled on magnetic tape for editing and processing. Preliminary computer processing consisted largely of checking that codes were in scope and consistent where interrelationships existed. Cross references between the information on the schedules and dwelling forms were also checked for consistency.

Finally a fully edited magnetic tape was created for analysis. A complete description of the tape records, together with associated notes on coding conventions used in the records, is given in Annex B6.

#### DETAILED RESULTS AND ANALYSES

The results of this phase of the study fall into four main categories:

. Analysis of sample characteristics (sections 1 and 6 of the questionnaire) including age, occupation, marital status, income distribution and household size; the results are reported in Annex CB

Analysis of travel characteristics (section 2 of the questionnaire) including driving licence status, mode choice for various trip tasks, and number of bus trips usually made each week; the results of this analysis appear in Annex CC

Analysis of the results of the two ranking questions (section 3 of the questionnaire) which relate to bus design features and service characteristics; results are presented in Annex CD

Analysis of the rating scores assigned to the 63 options considered for the 13 design objectives (section 4 of the questionnaire); results presented in Annex CE.

In addition, a brief analysis of preferences for interior and exterior colour schemes is presented in Annex CF.

Variational analyses were performed on the results of the rating questions to observe response differences by respondents:

- Sex
- Age group
- Licence status
- Bus use frequency
- Occupation group

Income group

Statistical tests were performed on the results of the ranking and rating question results to determine the significance of departures from statistically predicted or assumed results.

BUS DESIGN AND TRAVEL CHARACTERISTICS

Respondents were asked to rank two sets of characteristics. The first set contained 12 aspects of bus design, while the second set, containing 10 items, was concerned with bus service characteristics.

Travelling comfort and seat availability were ranked almost equally as the most desirable in the first set. Bus cleanliness and ride smoothness were ranked as next important. Fare reduction was considered to have a low importance, with only interior style, colour scheme and exterior style ranking lower. It is significant to note that reduction in travel time was ranked eighth whereas frequent service was ranked first in the second question indicating an appreciation by respondents that waiting time is an important part of total trip time, and that a reduction in waiting time is preferable to a reduction in in-vehicle time.

As stated above service frequency was ranked as most important of the service characteristic set contained in the second question. Reliability of service and service safety were ranked fourth with a somewhat lower rank total. Fare reduction of vandalism and the provision of timetables ranked lowest.

Tables C2.1 and C2.2 show the ranking for the characteristics presented in the first and second set respectively. The rank total for each characteristic is also given, and within its own set is inversely related to the importance of the characteristic.

The figures presented in Tables C2.1 and C2.2 are plotted in Figures C2.1 and C2.2 respectively.

Characteristic	Rank Order	Rank <sup>(a)</sup> Total
Seat availability		4018
Travel comfort	2	4065
Cleanliness	3	4330
Quiet and smooth ride	4	4658
Entry and exit	5	4974
Light, etc. control	6	5371
Pollution control	7	5550
Time reduction	8	5602
Fare reductions	9	6136
Interior style	10	8417
Colour scheme	11	9306
Exterior style	12	9723

TABLE C2.1 - BUS DESIGN CHARACTERISTIC RANKING (1ST\_QUESTION)

(a) The lower the rank total the higher the ranking

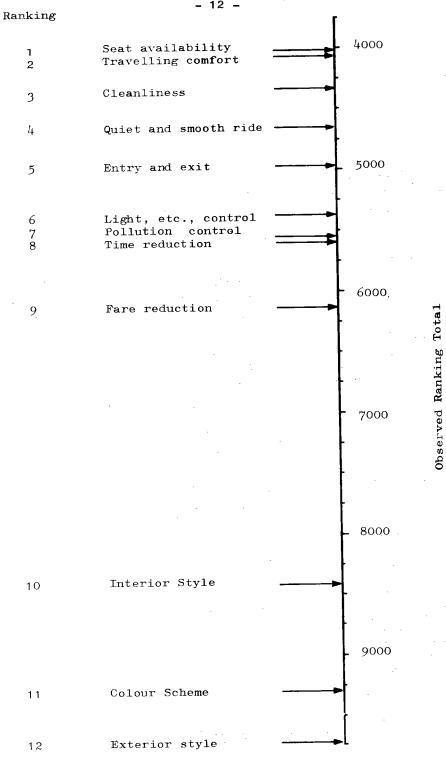

FIGURE C2.1 ORDER OF IMPORTANCE, 1ST RANKING QUESTION

-----

- 12 -

Characteristic	Rank Order	Rank <sup>(a)</sup> Total	
Frequent service Safety Reliable service Seat availability Distance to stops Shelters Express buses Fare reduction Reduced vandalism, etc	1 2 3 4 5 6 7 8 9	3449 3856 3867 4683 5335 5435 5506 5790 6532	
Timetables	10	6642	

### TABLE C2.2 BUS SERVICE AND TRAVEL CHARACTERISTIC RANKING 2ND QUESTION

(a) The lower the rank total the higher the ranking.

The results of this section of the questionnaire are remarkably similar to those obtained for rail car design options in the Brisbane Survey. Comfort and service frequency characteristics are valued ahead of reductions in fare indicating the possibility of recovering the cost of improvements to passenger comfort and service frequency by increased fares.

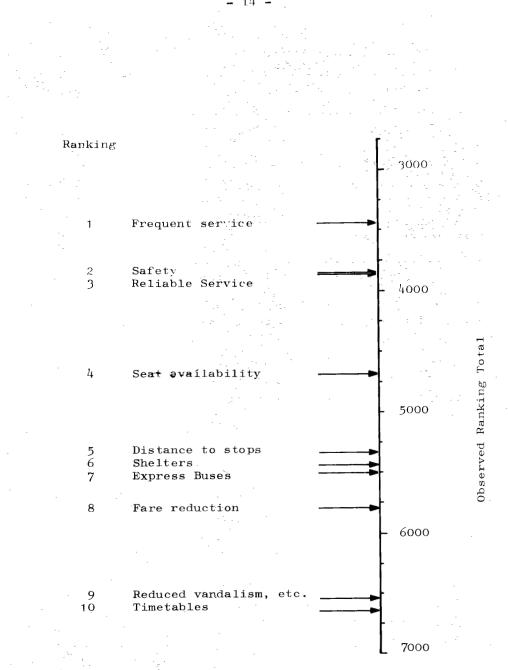

FIGURE C2.2 OF IMPORTANCE, 2 ND RANKING **QUESTION** ORDER

14

#### DESIGN OPTIONS

Sixty three separate design options were presented for assessment in the survey questionnaire. The design options were grouped into methods of achieving thirteen service improvements objectives:

- Bus cleanliness
- . Quiet and smooth ride
- Reduction in travel time
- Ease of entry
- . Increasing seat capacity
- . Control of light, temperature and ventilation
- Exterior design
- . Seat arrangement
- . Seat design
- . Supports for standing passengers
- . Shelter design
- . Reduce vandalism and improve security
- Providing time table information

Respondents were asked to rate each available design option in terms of its desirability and implied suitability in achieving the appropriate design objective. A seven point rating scale<sup>(1)</sup> was used to grade responses. It would be possible for an individual to rate each option equally, implying an equal amount of preference for each option.

While mean response is one method of measuring the desirability or effectiveness in fulfilling the objectives, a further appreciation of the respondents' feelings on each option may be obtained from the response distributions presented in Annex CE. Another point is that while a comparison between methods presented for each objective using the mean response is expedient, it is not statistically rigorous.

 <sup>(1)</sup> The rating scale used was: highly undesirable (1), undesirable (2), slightly undesirable (3), uncertain or indifferent (4), slightly desirable (5), desirable (6), highly desirable (7).

As in the ranking questions respondents placed most emphasis on options relating to comfort and reduced travel times. In the following paragraphs, those objectives which received the highest response, are discussed in relation to the suggested methods of achieving them.

A list of the options and their ratings are presented in Table C2.3.

#### Bus Cleanliness

Frequent cleaning of seats and interior panels together with the provision of rubbish containers in buses and the use of stain proof materials were rated higher than 'desirable'. The remaining options were all rated higher than slightly desirable. The average rating for the provision of rubbish containers is depressed by a significant number of respondents considering the option as undesirable who were possibly concerned with smells or the practicability of their use.

#### Quiet and Smooth Ride

Smooth starting and stopping was rated as the most effective way of achieving this objective. This is a low cost option, costing almost zero if driver training is used to effect this option. Good suspension and springing, regular attention to rattles and squeaks and a quiet engine and gearbox were also rated higher than 'desirable'. All but one of the remaining options were rated highly. The exception, windows which cannot be opened, received a rating of 2.66. This result is possibly attributable to the warm climatic conditions in Perth and the opening-window arrangement incorporated in existing MTT buses.

#### Reduction in Travel Time

A reliable service, i.e. with buses running on time, was considered the most desirable way of achieving reduced travel times. Frequent bus services together with close route spacings, and express services, were also rated highly.

TABLE C2.3 - RESPONSE TO DESIGN OPTIONS (Cont.)

#### Ease of Entry

All the options offered as solutions to this objective were rated highly. All are low cost items although they may involve a reduced passenger capacity in buses incorporating them.

#### Increasing Seating Capacity

Respondents rated options which provided more seating capacity and more seats to travellers as desirable.

#### Control of Light and Ventilation

All the options presented for this objective were rated as slightly desirable, except for transparent roof panels which were rated as slightly undesirable. None of the options were rated higher than desirable and many exhibited bimodal responses indicating uncertainty (perhaps through a lack of technical knowledge) about the option offered.

#### Exterior Design

The three designs depicted for this option resembled approximately:

- . Bus Design 1 recent MTT models
- . Bus Design 2 NSWPTC Leyland Leopard
- Bus Design 3 Washington DC tourist coach (a
- futuristic design in comparison with 1 and 2)

The bus resembling the MTT models was most favoured. Bus design 3 was next favoured and bus design 2 was rated last with an indifferent or uncertain rating.

#### Seating Arrangement

Bus design 1 which had all seats forward facing received the highest rating. The other two designs which had a decreasing number of seats received lesser ratings with design 3 having the least number of seats, rated as slightly undesirable with a mean rating of 2.95.

#### Seat Design

The seat design options received response ratings proportional to their apparent comfort.

#### Supports for Standing Passengers

The support depicted in design 1; a waist height grip incorporated with the back of the seat, was most favoured. The other designs were rated in accordance with the height of the support, with overhead straps receiving the lowest rating score.

#### Shelter Designs

The shelter affording the better weather protection was rated highest.

#### Reduce Vandalism and Improve Security

Conductors on buses was rated highest of the options considered. Checks by uniformed inspectors was rated as more effective than checks by plain-clothes inspectors. Closed circuit television was rated as slightly undesirable.

#### Providing Timetable Information

All the options were rated above slightly desirable with easily remembered timetables receiving the highest rating.

#### ANNEX CA

#### HOUSEHOLD SURVEY FORMS

Three forms were used in the household survey; a Dwelling Form, a Personal Schedule and Dwelling Control Data Form. Several prompt cards relating to the Personal Schedule are illustrated.

#### DWELLING FORM

The interviewers were issued with one Dwelling Form per sampled household which listed on the first page the household address, further location information where necessary; e.g., where street numbering was non-existent or doubtful, and Statistical area information as follows:

- . Local Government Area
- . Local Government Area Part
- . Collector District
- Primary Sampling Unit
- Block number
- Dwelling number.

The following set of introductory remarks intended to prompt the interviewer and be used as guidelines for the explanation of the survey origins and aims were also included:

NORMAL INTRODUCTION - (NOTE THAT YOU REPRESENT THE METROPOLITAN TRANSPORT TRUST AND THE BUREAU OF TRANSPORT ECONOMICS)

THE BUREAU OF TRANSPORT ECONOMICS AND THE METROPOLITAN TRANSPORT TRUST ARE CONDUCTING A SURVEY TO FIND OUT SOME OF THE ATTITUDES THAT BUS TRAVELLERS AND OTHER PEOPLE HAVE TO BUS DESIGNS AND BUS SERVICES.

THE RESULTS OF THE SURVEY COULD HAVE A CONSIDERABLE INFLUENCE ON FUTURE BUS DESIGN AND THE OPERATION OF BUSES.

I WOULD LIKE TO OBTAIN THE OPINIONS OF THE MEMBERS OF YOUR HOUSEHOLD ON THESE SUBJECTS?

ALL DETAILS THAT YOU GIVE TO ME WILL REMAIN STRICTLY CONFIDENTIAL.

Space was then provided for personal information about the household occupants. The information required was:

- Full name (optional)
- Relationship to head
- $\mathbf{Sex}$
- Age last birthday
- Marital Status
- Whether respondent was in scope
- Date personal schedule obtained from respondent.

On the reverse side of the form a table was provided for the interviewer to log a summary of household calls which included the date and time of each call for each person. An area was also provided for the interviewers use to record notes and any comments made by the respondents.

#### PERSONAL SCHEDULE

#### Introductory Remarks

THE BUREAU OF TRANSPORT ECONOMICS AND THE METROPOLITAN TRANSPORT TRUST ARE CONDUCTING A SURVEY TO FIND OUT SOME OF THE ATTITUDES THAT BUS TRAVELLERS AND OTHER PERSONS HAVE TO BUS DESIGN AND BUS SERVICES.

THE RESULTS OF THE SURVEY COULD HAVE A CONSIDERABLE INFLUENCE ON FUTURE BUS DESIGN AND THE OPERATION OF BUSES.

COULD I HAVE YOUR OPINION ON THESE SUBJECTS?

Personal Information: Section 1

This information, personal particulars of the respondent, was transferred from the Dwelling Form to the Personal Schedule by the interviewer.

Question 1 - Relation to Head

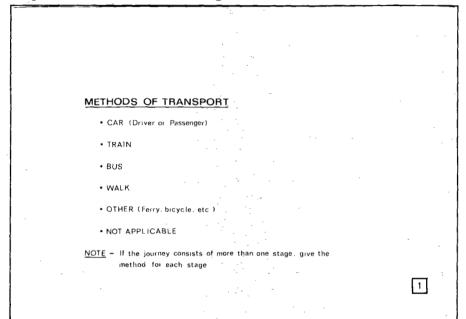

- 1. Head 5. Parent/in-1aw
- 2. Spouse

- 6. Visitor
- Son/daughter
- 7. Other
- 3.
- Brother/sister 4.

Question 2 - Sex 1. Male 2. Female Question 3 - Age 00-04 6. 30-39 1. 05-09 7. 40-49 2. 3. 10-14 8. 50**-**59 60-69 4. 15-19 9. 20-29 10. 70 and over 5. Question 4 - Marital Status 3. 0 ther1. Now married 2. Never married Questions relating to the respondents trip making habits: Section 2 I WOULD NOW LIKE TO ASK SOME QUESTIONS ABOUT YOUR METHODS OF TRANSPORT Question 5 - Do you hold a current Driver's or Motor Cyclist's License? 1. Yes 3. Not eligible 2. No Question 6 - What Transport methods do you usually use to travel to? - (prompt: we require details of all the methods used in a journey \_ the number of times one method is used on a journey (Issue prompt card 1) Activity Mode Bus(3) Walk(4)Tram(2)Car(1)Other(5) N/A(6)Work School, Uni. Shopping Social or Recreat OtherActivities

- 25 -

For the typical journey for each type of activity, the number of times each mode was used was recorded by repeating the mode number - (1), (2), etc., the appropriate number of times. A four digit code was developed for each activity containing the appropriate codes, which would include zeros. As an example, a journey involving walking, car travel and walking would be coded 4140.

Prompt Card 1 is shown in Figure CA.1 below:

#### FIGURE CA.1

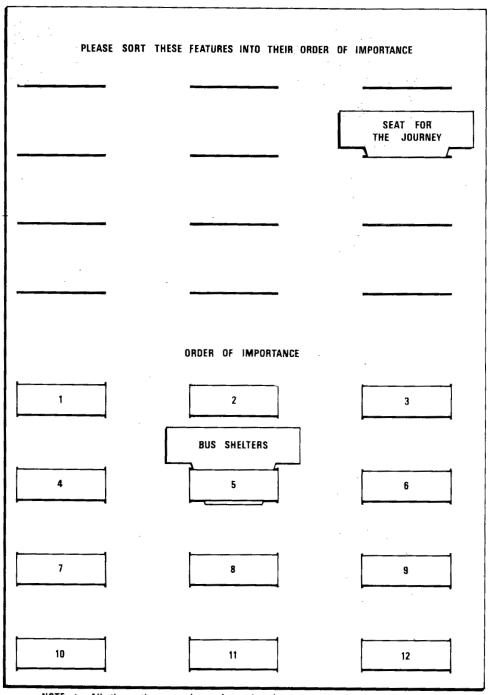

<u>Question 7</u> - How many Bus Trips do you usually make each week? (Prompt - a trip is a single one way journey)

Ranking Questions: Section 3

I WILL NOW GIVE YOU A BOARD WHICH SHOWS CERTAIN FEATURES OF BUS DESIGN AND TRAVEL. EACH FEATURE IS WRITTEN ON A LIFT OFF TAG - (ISSUE SUFFLE BOARD 1) WILL YOU CHOOSE THE FEATURE WHICH YOU THINK IS THE MOST IMPORTANT LIFT THE TAG OUT AND PLACE IT IN THE NUMBER 1 POSITION AT THE BOTTOM OF THE BOARD. CONTINUE SELECTING FEATURES IN THEIR ORDER OF IMPORTANCE DOWN TO THE FEATURE WHICH YOU CONSIDER IS THE LEAST IMPORTANT.

A pictorial representation of the type of shuffle board used is shown in Figure CA.2 - 27 -

l

NOTE : All the option tags (not shown here) were randomly positioned by the interviewer in the slots at the top of the board before the respondent sorted them into order immediately below.

FIGURE CA.2 RANKING QUESTION SHUFFLE BOARD Question 8 - Bus design (first question)

Cleanliness Quiet and Smooth Ride Time Reduction Entry and Exit Seat Availability Fare Reduction Light, etc. Control Exterior Style Interior Style Travelling Comfort Pollution Control Colour Scheme

I HAVE ANOTHER CARD SHOWING CHARACTERISTICS OF BUS TRAVEL. WILL YOU PLEASE SORT THESE IN A SIMILAR WAY TO THE LAST QUESTION. (Issue shuffle board 2)

Question 9 - Bus service and travel (second question)

Seat Availability Frequent Service Distance to Stops Reliable Service Safety Fare Reduction Shelters Express Buses Reduced Vandalism, etc. Timetables Rating Questions: Section 4

I AM NOW GOING TO ASK FOR YOUR ASSESSMENT OF A NUMBER OF FEATURES OF BUSES AND BUS SERVICES.

AS I READ OUT THESE FEATURES, I WANT YOU TO ASSESS HOW DESIRABLE OR UNDESIRABLE EACH FEATURE IS. SELECT YOUR ANSWERS FROM ONE OF THE SEVEN HEADINGS ON THIS CARD. (Issue prompt card 2)

Prompt Card 2 is shown in Figure CA.3 below:

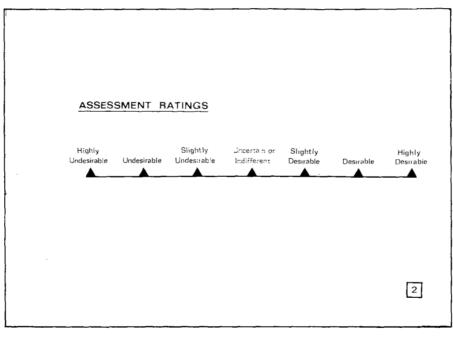

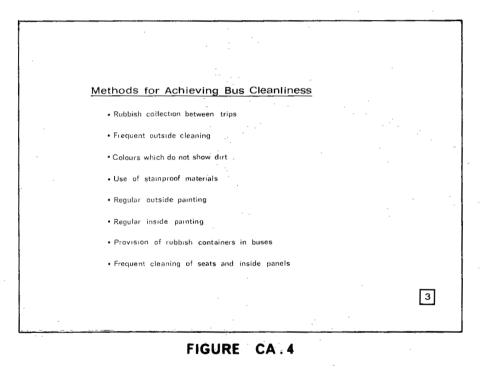

FIGURE CA.3

<u>Question 10</u> - Firstly, I would like you to consider methods of achieving Bus Cleanliness. Please give me your assessment of - (Issue prompt card 3)

Prompt Card 3 is shown in Figure CA.4 below:

<u>Question 11</u> - There are several ways to obtain a quiet and smooth ride in buses. What is your assessment of the following? - (Issue prompt card 4)

Prompt Card 4 is shown in Figure CA.5 below:

	-
Ways of Obtaining a Quiet & Smooth Ride	
• Windows which cannot be opened	
Quiet engines and gearboxes	
Regular attention to rattles and squeaks	
Softly padded seats	
Fauly padded seats	
• Non-stip seat materials	
Smooth starting and stopping	
Good suspension and springing	
Snund-proofed walls and floors	.51
	4
 	÷.

<u>Question 12</u> - Will you now give me your assessment of the following ways to reduce travel time. (Issue prompt card 5)

Prompt Card 5 is shown in Figure CA.6 below:

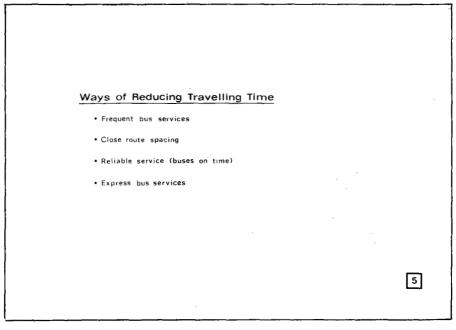

FIGURE CA.6

<u>Question 13</u> - Another aspect of Bus Design is the arrangement made for passengers to enter and leave the Bus. How desirable are the following? - Issue prompt card 6)

Prompt Card 6 is shown in Figure CA.7 below:

·	
Methods for Improving Entry & Exit	
• Low steps	
• Wide doors	
• Easily operated doors	
• Quick methods of paying fare	
	6

Not Applicable

Don't care 5

#### Dwelling Control Data Form

The address and personal information of household occupants contained on the Dwelling Form was transferred by the BTE to a Dwelling Control Data Form.

The additional items of information entered on the data form were:

- A dwelling number arbitrarily assigned to each dwelling
- A card code/number used for data key punched card cross reference; there were two cards per Data Form, referenced 11 and 12
- A completion code to indicate survey response (see Annex CG for Code)
- . An arbitrary BTE developed suburb code;
- . Response details: These included the number of:
  - Persons in household
  - Persons in scope
  - Personal schedules obtained

and

An interviewer identification code,

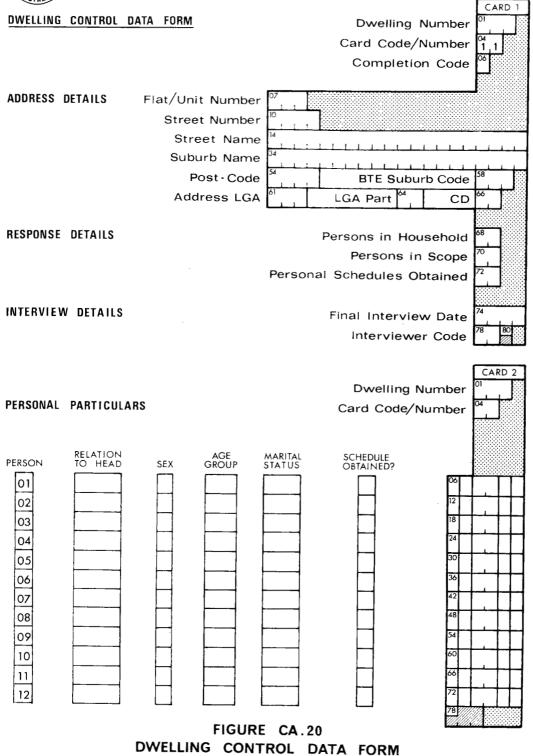

A copy of the Data Form is presented in Figure

CA.20.

.

PERTH BUS DESIGN SURVEY

#### ANNEX CB

#### SAMPLE CHARACTERISTICS AND COMPARISONS

Before commencing interviews, the interviewers were required to enter the personal particulars of every occupant of the sampled household onto a Dwelling Control Data Form. The information included:

- . Relation to head
- . Sex
- Age
- . Marital status.

and was transferred to the Personal Schedule of each respondent. In addition the respondents were requested to supply details of their occupation and income level. In this Annex, tabulated details of this information are presented, together with comparisons with similar results for the entire Perth Statistical Division. Comments on the significance of differences between the sample and the population are also made.

In this phase of the study, respondents (i.e. those who actually completed the questionnaire) were all fifteen years of age or older.

#### SAMPLE CHARACTERISTICS

The major sample characteristics tabulated in the analysis of summary results were as follows:

- Age distributions (respondents and all occupants)
- Occupation distribution (respondents only)
- . Marital status (respondents and all occupants)
- . Income distribution (respondents only)
- . Household size distribution.

Details of these distributions are presented in the following sub-sections. Distributions are categorised by sex, and relate to those households which provided completed personal schedules.

## Age Distribution

Age distribution of respondents (males, females and total) are given in Table CB.1, while corresponding distributions for all occupants are given in Table CB.2.

TABLE CB.1 - AGE DISTRIBUTIONS (R	RESPONDENTS ON	LY)
-----------------------------------	----------------	-----

Age Groups	Number of Respondents		
	Male	Female	Total
15-19	56	73	129
20-29	108	116	224
30-39	- 76	89	165
40-49	73	82	155
50-59	64	64	128
60-69	38	50	88
70 and over	22	24	46
Unstated	0	0	0
Total	437	498	935

# TABLE CB.2 - AGE DISTRIBUTION (ALL OCCUPANTS)

Age Groups	Number of Occupants				
	Male	Female	Unstated	Total	
00-04	54	38	1	93	
05-09	72	77	0	149	
10-14	82	61	0	143	
15-19	67	75	0	142	
20-29	121	122	0	243	
30-39	88	94	0	182	
40-49	82	88	0	170	
50-59	74	68	0 .	142	
60-69	43	53	0	96	
70 and over	27	33	0	60	
Unstated	3	5	96	104	
Total	713	714	97 <sup>-</sup>	1 524	

Occupation Distribution

The occupation distribution for respondents are given below in Table CB.3.

Occupation Group	Number of Respondents			
	Male	Female	Total	
Full-time employment	330	149	479	
Part-time employment	8	50	58	
Looking for work	7	8	15	
Student	37	44	81	
Pensioner or retired	40	49	89	
Housewife	0	184	184	
Other	13	14	27	
Unstated	2	0 .	2	
Total	437	498	935	

TABLE CB.3 - OCCUPATION DISTRIBUTION (RESPONDENTS ONLY)

The occupation groupings do not correspond to those normally used by the ABS. A more detailed breakup was not considered relevant to the analysis of results.

# Marital Status Distribution

Marital status information is available for both respondents and sampled household occupants, and are presented in Tables CB.4 and CB.5 respectively.

# TABLE CB.4 - MARITAL STATUS DISTRIBUTION (RESPONDENTS ONLY)

Marital Status	Numb	er of Responder	nts
	Male	Female	Total
Now married	313	336	649
Never married	114	112	226
Other	10	50	60
Unstated	0	0	0
Total	437	498	935

TABLE CB.5 - MARITAL STATUS DISTRIBUTION (ALL OCCUPANTS)

Marital Status	Number of Occupants			
	Male	Female	Unstated	Tota1
Now married Never married Other Unstated	357 342 13 1	363 296 55 0	0 1 0 96	720 639 68 9 <b>7</b>
Total	713	714	97	1 524

The marital status categories have also been abbreviated from the normal ABS system for simplicity. It will be noted that there was a much lower response to the category "Other", as only four percent were in this category compared with 16 percent in the household survey (Table BB.3).

#### Income Distribution

Income information was collected only for respondents, and related to individual income, rather than household income. The respondents' weekly income was categorised in fourteen groups incremented by \$20 to \$260 and over. To allow for respondents who were more familiar with their annual salary levels, the annual equivalent was also provided for each grouping. This distribution is shown for respondents below in Table CB.6.

Weekly Income	Number of Respondents			
Group	Male	Female	Total	
0- 19	- 40	212	252	
20- 39	27	75	102	
40- 59	20	54	74	
60- 79	19	43	62	
80- 99	45	57	102	
100-119	73	27	100	
120-139	81	9	90	
140-159	444	7	51	
160-179	24	2	26	
180-199	· 16	4		
200-219	14	1	15	
220-239	5	0	. 5

260 or over	12	· 1 ·	13	
Unstated	9	6	15	
	437	498	935	

## TABLE CB.6 - INCOME DISTRIBUTION (INCOME)

Household Size Distribution

The distribution of household size for the sample was obtained from the dwelling information form. This distribution is presented in Table CB.7.

Size of Household	Number of Households		
1 Person	67		
2 Persons	152		
"	72		
**	87		
"	52		
n	27		
7 persons	4		
8 or more persons	7		
Unstated	80		
Total	548		

TABLE CB.7 - HOUSEHOLD SIZE DISTRIBUTIONS

# COMPARISON WITH PERTH STATISTICAL DIVISION

In order to establish differences between the survey sample and the general Perth populace, selected sample characteristics were compared with the corresponding characteristics of the entire Perth Statistical Division<sup>(1)</sup>.

The basis of comparison was to generate sample and Perth fractional distributions of particular characteristics. In generating these fractional distributions for the sample, respondents or occupants whose characteristics were missing or incomplete were omitted. In addition, only complete distributions were considered (i.e. the break-up of respondents or occupants into male and female distributions was not performed). Because of the departures from the ABS, standard categorisations, only the age groups of respondents and all occupants and the household size distributions can be compared.

Age distributions for sample respondents and occupants are compared with those in Perth in Figure CB.1. The differences between the sample and Perth are insignificant - particularly in the case of respondents. There is one major differences in the 'all occupants' distribution for the 00-04 age group. This could have arisen naturally since the

(1) 1971 Census.

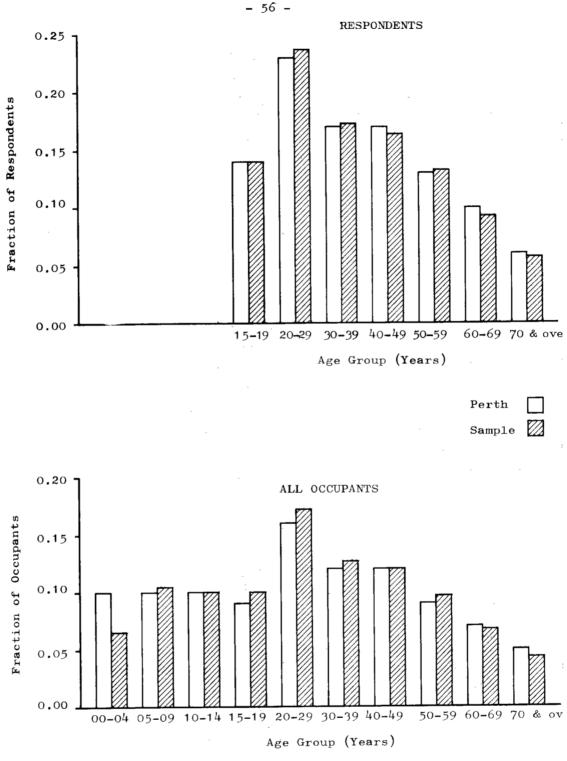

FIGURE **CB**.1 COMPARISONS OF AGE GROUP DISTRIBUTIONS

\_

1971 census through a declining marriage and birth rate (1).

A comparison in household size distribution is shown in Figure CB.2. The variation appears as an increase in one and two person households and a decrease in three or more person households. Once again the departures are explainable by shifts in workforce composition and a declining birth rate i.e. more unmarrieds, more childless couples and fewer children in families.

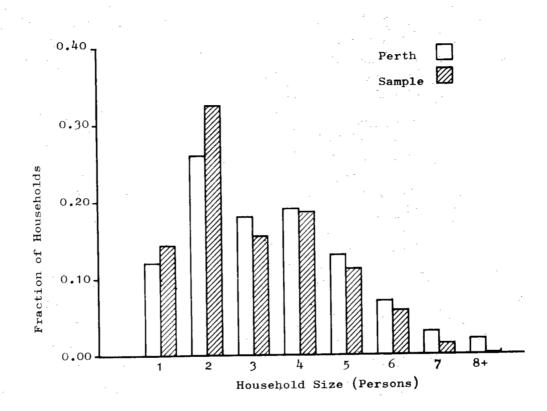

#### Statistical Significance

The sample distributions were not tested for similarly to those of the Perth Statistical Division because of the difference in time between the survey and the 1971 Census. With the rigorous sampling techniques used the sample should be representative and the departure from normality random.

(1)	Quarter1y	Summary of	Australian	Statistics,	December
	1974, No.	294, ABS Ca	nberra.		

Year	Marriages (WA)	Births (WA)
1971	9,382	24,239
1972	9,120	22,177
1973	9,102	20,510

- 57 -

# FIGURE CB.2 COMPARISON OF HOUSEHOLD SIZE DISTRIBUTION

#### ANNEX CC

# RESPONDENTS TRAVEL CHARACTERISTICS

There were three questions in the survey relating to respondents travel characteristics. These questions included:

- Driving licence status
- Mode choice for the following five trip task categories:
  - Work
  - Education
  - Shopping
  - Social and Recreational
  - Other activities
- Number of bus trips usually made each week.

Questions of this type were included not to examine the respondents travel characteristics but to analyse their attitudes in correct context. Because of the secondary nature of the questions only the distributions are presented in this Annex.

## Driving Licence Status

Three categories of driving licence status were included on the questionnaire:

- Licenced
- . Not licenced
- . Not eligible

The last category, perhaps an unnecessary refinement was included for those under age, with disabilities and for those disqualified. The distribution for respondents only using this categorisation is presented below in Table CC.1

Licence Status	Male	Female	Total	
Licenced	378	287	665	
Not licenced	37	179	216	
Not Eligible	21	32	53	
Unstated	1	0	1	
Total	437	498	935	

TABLE CC.1 - LICENCE STATUS (RESPONDENTS ONLY)

#### Modal Choice

In this question respondents were asked to nominate the travel methods usually used and their order of use for six trip purposes. A coding was provided for trip types not normally undertaken. The responses were analysed to determine the current modal choice for each of the activities of interest. To overcome the problem of multiple mode choise a hierarchy of modes was used to determine the dominant mode from the access or secondary modes. The mode choices considered in order of dominant mode selection and their questionnaire coding are:

<u>Order</u>	Mode	$\underline{Code}^{(1)}$
1	Train	2
2	Bus Car	3 1
4 5	Other Walk	5 4

1.1

The modal choice for males and females for each activity is presented in Table CC.2 below.

The calculated modal choice does not include details of trip frequency and therefore does not correspond to the usual modal split. Bus is the dominant public transport mode with an average of 10 percent males and 24 percent females using the mode.

(1)The Code refers to the mode number used in Question 6 of the Personal Schedule (Annex CA).

# - 60 -

TABLE CC.2	-	MODE	SPLIT	$\mathbf{B}\mathbf{Y}$	TRIP	PURPOSE

Trip Purpose		Male Mode Split			Female Mode Split					
	Train	Bus	Car	$0  { m ther}$	Walk	Train	Bus	Car	Other	Wall

Average	0.02	0.10	0.78	0.04	0.04	0.01	0.24	0.63	0.01	0.1

. 

# Trips per Month by Bus

The number of trips per month which each respondent travelled by bus has a bearing on his or her attitudes and consequently is significant when interpreting responses. Variational analyses based on this factor have been undertaken but are not reported because of space limitations. Presented below in Table CC.3 is the distribution of number of trips categorised with seven groups incrementing by ten for males and females.

Trips per Month	Male	Female	Tota1	Percentage
Zero trips	336	255	591	63
1-10	27	91	118	13
11-20	13	60	73	8
21-30	7	19	26	3
31-40	30	41	71	7
41-50	10	21	31	3
50 and over	14	11 .	25	3
Total	437	498	935	100

TABLE CC. 3 - NUMBER OF BUS TRIPS PER MONTH

It is important to note that while a significant proportion of the sampled respondents make less than 10 trips per month, the findings of the survey are in no way diminished. Non users attitudes are important by the degree of their numbers if they as a group are to be attracted to future bus services.

.

#### ANNEX CD

#### BUS AND BUS TRAVEL CHARACTERISTICS RANKING ANALYSIS

In Section 3 of the questionnaire respondents were asked to rank two sets of bus and bus travel characteristics. After the respondents physically ranked the characteristics with the aid of a shuffly board the interviewer numerically ranked them from 1 (highest) to 12 for the first question (Question A) and to 10 for the second question (Question B). The characteristics listed for ranking in each question were:

# Question A

# Question B

Cleanliness	В1.	Seat Availability
Quiet and Smooth	В2.	Frequent Service
Ride	вз.	Distance to Stops
Time Reduction	в4.	Reliable Service
Entry and Exit	B5	Safety

#### ANALYSIS OF RANKINGS

Ranking analysis of this type require a full complement of rank orders for each respondent. Rankings which were not complete were rejected. On this account 10 and 6 schedules were rejected respectively from the first and second question. The rank total and the order of their ranking are presented for each question in Table CD.1 below.

Qu	estion A		Que	estion B	
Question	Rank Total	Rank Order	Question	Rank Total	Rank Order

A12	9306	11	_	-	· 🗕

TABLE CD.1 - RANKINGS

## SIGNIFICANCE OF RANKING

Two methods were used to test significance of the final rankings shown in Table CD.1. In the first test, a 'co-efficient of concordance' was computed. This co-efficient is a measure of agreement between respondents, and varies between zero (no agreement) and unity (complete agreement). On a null hypothesis that there is no agreement between respondents, the expected rank totals would be equal, and would have the following value:

 $E_{i} = N(n + 1)/2$ where  $E_{i}$  is the expected rank total for characteristic i, N is the number of respondents, and n is the number of characteristics.

If, in fact, there were complete agreement between respondents, the sum of squares of deviation of observed rank totals from expected rank totals would be a maximum, and could be shown to have the value:

$$S' = N^2 (n^3 - n)/12$$

where S' is the maximum sum of squares of deviations.

The co-efficient of concordance (W) is now defined

as:

with  $S = (O_i - E_i)^2$ 

where S is the observed sum of square of deviations from expected rank totals

and 0<sub>i</sub> is the observed rank total for characteristics i.

In the cases under consideration, the following values apply:

Question A	<u>Question B</u>
N = 925	N = 929
n = 12	n = 10
$E_{i} = 6012.5$	$E_{i} = 5109.5$
$s' = 1.224 \times 10^8$	$s' = 0.7120 \times 10^8$

In Table CD.2, values of observed and expected rank totals for each characteristic are shown, together with the deviations and squares of deviations for Questions A and B respectively.

TABLE	CD.2	_	DEVIATIONS	FROM	EXPECTED	RANK	TOTALS

TABLE CD.2 - DEVIATIONS FROM EXPECTED RANK TOTALS (Cont.)

From these values, W is computed as:

Question A	Question B	-
0,365	0.159	1

These values tend towards the middle of the scale, however there is clear agreement on ranks for the more important characteristics.

The other test performed was a variance ratio or F-test. The F-statistic is computed as:

$$\mathbf{F} = \frac{\left(\mathbf{W} - \mathbf{1}\right)\mathbf{W}^{\dagger}}{\mathbf{1} - \mathbf{W}^{\dagger}}$$

where W' is a corrected derivative of W.

In this case, the correction of W to determine W' is insignificant, and:

	Question A	Question B
	F = 533	F = 173
with	V <sub>1</sub> = 11	v <sub>1</sub> = 9
	$V_2 = 10285$	v <sub>2</sub> =8406

where  $V_1$  and  $V_2$  are upper and lower estimated degress of freedom, respectively.

Consultation of tables<sup>(1)</sup> of the F distribution with the values of F,  $V_1$  and  $V_2$  given above yields the following result:

(1) M. Abramowitz and Irene A. Stegun, <u>Handbook of</u> <u>Mathematical Functions</u>, U.S. National Bureau of Standards, 1964. 0.001

where

Р

P is the probability that the observed deviations could have arisen by chance if there were no agreement between respondents.

This result may be interpreted by stating that it is extremely unlikely that there is not significant agreement between respondents. In general, the deficiencies in the nature of the co-efficient of concordance would indicate that the F-test is a somewhat more reliable indicator of agreement in rankings of this type.

#### ANNEX CE

### BUS AND BUS TRAVEL CHARACTERISTICS RATING ANALYSIS

The major part of the survey questionnaire consisted of questions relating to the respondents' assessment of various methods of achieving specific design objectives. These methods were presented in Section 4 of the questionnaire (see Annex CA).

Design Options are identified by letter and number combinations which are listed in Table CE.1. Results for each of the 63 options are presented in order of their appearance in the questionnaire and each set of results occupies a page (see the latter part of this Annex).

Respondents were asked to rate the option on a seven point scale which was given a numeric equivalence by the interviewer; the ratings and their numeric equivalences are:

Description	Value
Highly undesirable	1
Undesirable	2
Slightly undesirable	3
Uncertain or indifferent	4
Slightly desirable	5
Desirable	6
Highly desirable	7

For each option, a distribution is presented by sex showing for each option the corresponding numbers of male and female respondents who rated the option at each rating scale value. At the foot of the distribution tabulation, the average numeric rating is given for each sex and for all respondents taken together.

The tabulated distribution is also presented in the form of two histograms; one for males and the other for females.

TABLE CE.1 - CORRESPONDENCE BETWEEN OPTIONS, OBJECTIVES AND

Brief comments on the rating results are attached as a footnote to each result page. These comments include remarks on significant differences which became apparent after variational analyses were performed on categorisation distributions other than sex. Distributions also looked at were by:

- . Age
- . Motor vehicle licence
- Trip load
- Occupation
- . Income group

Chi-square tests were performed during the variational analyses to determine whether significant differences could be assumed between respondents in different demographic groups. The results are not reported here for brevity; however, as stated above, comments are made where considered appropriate.

## HISTOGRAM OF RESULTS

# COMMENTS ON RESULTS

The Perth winter climate is very mild; however the bimodal result (4.74 mean response with 21 percent respondents rating the option as undesirable) is surprising when this comfort convenience is fitted to most automobiles as standard equipment. Respondents rating in the negative may have considered the option as involving an increase in cost.

# HISTOGRAM OF RESULTS

#### COMMENTS ON RESULTS

Air conditioning was rated seventh out of the eleven methods considered for the objective. The low mean rating of 5.01 resulted from a substantial 19 percent response rating of undesirable. An explanation of the negative response to this generally attractive improvement in other applications may be reservations by respondents on its effectiveness and cost.

ANNEX CF

### COLOUR SCHEME PREFERENCES

In Section 5 of the questionnaire (Questions 23, 24 and 25) respondents were asked to register their colour and shade preferences of bus exteriors, interiors and seats. Although public acceptance of colour scheme is not a significant factor in mode choice the acceptance of the other factors may be influenced by a pleasing scheme.

The existing colour scheme of the MTT fleet has an influence on the stated preference. At the time of the survey the colours used were:

- . Larch Green (Dulux No. 3932940) Exterior
- . Moon White (Dulux No. 39302946) Exterior and Interior.

A wide range of colour choices was available to the respondents, with provision for a colour choice other than those listed and registration of no preference whatever. The shade options available were:

- . Light
- . Medium
- . Dark
- . Not applicable
- . Don't care.

An option of natural was only available for the exterior colour.

Colour and shade preference distributions for the exterior of buses are shown in Table CF.1 while similar distributions for interior and seating colours are shown in Table CF.2 and CF.3 respectively.

The preference for interior/exterior and interior/ seat colour combinations are shown in Tables CF.4 and CF.5 respectively.

Respondents overwhelmingly favoured the MTT colour scheme of:

- . Green exterior
- . Cream interior
- . Brown/green seats.

Yellow and Blue were the only significant alternate exterior colour preferences. Green and blue were next favoured as interior colours. Blue also was significantly preferred as an alternate seat colour. The cross referenced colour scheme distributions reinforces the favourable response to the MTT scheme.

It is difficult to estimate the influence the MTT scheme has had in preconditioning the respondents preferences. Care should be exercised when considering these results for other bus services.

ANNEX CG

### HOUSEHOLD SURVEY DATA FILE FORMAT

This annex contains details of the coding and storage of edited survey records on magnetic tape. The information is organised into two files:

- . Dwelling and personal data
- . Personal schedule results

Notes referred to in the record listing are explained in the section following the listing.

DWELLING CONTROL FILE

#### Format

The record format for the dwelling control data file is scheduled below:

				(1)
	<u>Field</u>	Bytes	Contents of Field	Notes (1)
-	Household	Informatio	<u>on</u>	
	1	01- 03	BTE dwelling number	· · 1
	2	04	BTE completion code	2
-	3	05- 07	Flat or unit number	3
	4	08- 11	Street Number	3
	5	12- 31	Street name	5
	6	32- 51	Suburb name	6
	7	52- 55	Postcode	
	8	56 <b>-</b> 58	BTE suburb code	7
	9	59 <b>-</b> 61	Address LGA	8
	10	62- 63	Address LGA Part	- 9
	11	64 <b>-</b> 65	Address CD	10
	12	66- 67	Number of persons in household	11
	13	68 <b>-</b> 69	Number of persons in scope	12
	14	70- 71	Number of personal schedules obtained	13
	15	72- 75	Final interview date	14
	16	76- 77	Interviewer code	15
-	Personal	Particular	<u>s</u> : First family member	
-	17	78	Relation to head	16
	18	79	Sex	17
	19	80- 81	Age group	- 18
	20	82	Marital status	19
	21	83	Schedule obtained?	20
	22-26	84- 89	2nd household member	21
	27-31	90- 95	3rd household member	-21
	32-36	96-101	4th household member	21
	37-41	102-107	5th household member	21
	42-46	108-113	6th household member	21
	47-51	114-119	7th household member	21
	52-56	120-125	8th household member	21
	57-61	126-131	9th household member	21
	62-66	132-137	10th household member	21
	67-71	138-143	11th household member	21
	72-76	144-149	12th household member	21

(1) Details of notes on following pages.

142

Each sampled dwelling was arbitrarily assigned a number.
 The BTE completion code denoted the response results for

the household and was coded as follows:

Code	Result
1	All personal schedules obtained
2	Some personal schedules obtained
3	No personal schedules obtained
4	Household vacant
5	Household out of scope.

Dwellings were defined as out of scope if they contained more than one permanent family group. The presence of boarders, visitors and members of group co-operatives did not invalidate a dwelling.

- 3. The flat or unit number was right justified in the field and contains alphanumeric characters (blanks if not appropriate).
- 4. The street number was right justified and contains numeric characters only.
- 5. The street name was left justified in the field. The types of street, i.e. road, crescent etc., were abbreviated using the normal conventions.

6. The suburb name is left justified.

- 7. An arbitrary code based on the alphabetical listing of suburbs in the Perth Statistical Division. The suburb/ code listing is presented in Annex BH.
- 8. This was the Australian Bureau of Statistics (ABS) local government area identifier.
- LGA Part was the ABS identifier for the local government part.
- Address CD was the ABS identifier for the Collector District from which the dwelling was sampled.
- 11. Persons present in the household on the night before the original approach and who were fifteen and older were in scope. A contact was made with at least one member of a household and if the number of inhabitants was not determined 99 was recorded.

- 12. If contact was made and the exact number of the inhabitants who were in scope was not determined, 99 was recorded.
- If no schedules were obtained and the number of inhabit-13. ants and the number in scope was not determined, 99 was recorded. For the case where the previous two items of information were known and yet no schedules were obtained, 00 was recorded.
- The final interview date was the date on which the last 14. completed schedule was obtained from the dwelling. Only the day and month was recorded e.g. the 10 September as coded 1009. If contact was made with one of the household members and no schedules were obtained 9999 was recorded.
- 15. A confidential number was supplied by the ABS to identify the schedules completed by each interviewer.
- 16. The head was defined in the normal sense of household leader. The relations are coded:
  - 1. Head
  - 2. Spouse
  - 3. Son/Daughter
  - Brother/Sister 4.
  - Parent/Inlaw 5.
  - 6. Visitor
  - 7.  $0 \, \text{ther}$
- 17.
- The sex of the household member is coded as:

Code	Sex
1	Male
2	Female

18.

Age groups were recorded using the following codes:

Code	Age Group
01	00-04 years
02	05-09 years
03	10-14 years
04	15-19 years
05	20-29 years
06	30-39 years
07	40-49 years
08	50-59 years

09	60-69 years
10	70 and over

19. Only three categories were used in the survey, and were recorded using the following codes:

Code	Marital Status
1	Now married
2	Never married
3	Other

20. The answer to this question was recorded using the

Code	Answer
1	Yes
2	No

21. The personal particulars obtained from the first household member (field 17 through 21) were obtained and recorded for all others who were present on the night before the initial contact. Where information was not obtained, 9 was recorded for a single byte, and 99 was recorded for a 2 byte field as appropriate.

### PERSONAL SCHEDULE FILE

The general characteristics of this data file are as follows:

#### Format

The format of each record in the file is shown in the following list.

		(1)
<u>Field</u>	Bytes	Content of Field Notus (1)
01	01-03	BTE dwelling number 1
02	04-05	Card record indentifier 2
03	06-07	Person number 3
04	08	Relation to head 4
05	09	Sex 5
06	10-11	Age 6
07	12	Marital status 7
08	13	Current motorists license 8

Code		Rating					
6	desirable						
7	highly desirable						
respondents	were	asked	$\mathbf{to}$	choose	from	а	comp

13.

The respondents were asked to choose from a comprehensive list of colours with provision for a colour preference not included. i.e. the registration of an indifference to any particular colour scheme. The colours were coded as follows with the selection of "natural" only available for exterior colour schemes.

Code		Colour
01		natural
02		white
03	•	cream
04	1 - 1 <sup>- 1</sup>	yellow
05		orange
06		red
07		green
08		blue
09	5. -	brown
10.		black
11		other (to be specified)
12	1	don't care

14.

The seven activity categories were coded as:

Code		Activity
1		full-time employment
2		part-time employment
3	* •	looking for work
4		student
5		pensioner or retired
6		housewife
7		other

15.

The weekly and corresponding annual gross income of the respondents were coded:

Code	Weekly Income (\$)	Annual Income	(\$)
01	0- 19	0- 1,039	
02	20- 39	1,040- 2,079	
03	40- 59	2,080- 3,019	

- 153 -

i

Code	Weekly_Income (\$)	Annual Income (\$)
04	60- 79	3,120- 4,159
05	80- 99	4,160- 5,199
06	100-119	5,200- 6,239
07	120-139	6,240- 7,279
08	140-159	7,280- 8,319
09	160-179	8,320- 9,359
10	180-199	9,360-10,399
11	200-219	10,400-11,439
12	220-239	11,440-12,479
13	240-259	12,480-13,519
14	760 or over	13,200 or over

ANNEX CH

### BTE SUBURB CODE DIRECTORY

Listed in alphabetical order are the Perth suburbs and their sequential code. Also listed for each suburb are the:

- . Local Government Area reference number
- . Map reference from Perth UBD street directory
- . Post Code
- . Northerly distance (km) from GPO
- . Easterly distance (km) from GPO
- . Range on direct line distance (km) from GPO
- . Bearing from true north

The approximate suburb centroid was used as the reference point to calculate distances and bearings.

			MAP	POST
